1. Introduction

There has been renewed interest in Discontinuous Galerkin Methods (DGM) recently, primarily due to the discovery that variants of these methods could be used effectively to solve diffusion problems as well as problems of pure convection. One such DGM was presented in the dissertation of Baumann [7] and reported in the paper of Oden, Babuška, and Baumann [18]; summary of other versions of DGMs and a lengthy historical review of this subject can be found in the record volume edited by Cockburn, Karniadakis, and Shu [10]. The DGM possesses a number of important properties that set them apart from traditional conforming Galerkin-finite element methods: they are elementwise conservative, can support high order local approximations that can vary nonuniformly over the mesh, are readily parallelizable, and, for time-dependent problems, lead to block-diagonal mass matrices, even for high-order polynomial approximations. These properties make DGMs attractive candidates for a broad collection of applications.

Several papers have been published in the mathematical literature on a priori error estimates for various DGMs for diffusion problems. In particular, an analysis of one-dimensional versions of the Baumann-Oden method was reported by Babuška, Oden, and Baumann [2]. Error estimates for several types of DGMs and for the related Internal Penalty Galerkin Methods were presented in the dissertation of Rivière [19] and in the paper of Rivière, Wheeler, and Girault [20]. Several other studies on a priori error estimates for DGMs have appeared recently; see, for example, the report of Chen [9] and the analysis of Süli, Schwab, and Houston [22,15]. Convergence analysis of other variants of DGM can be found in [10].

In the present work, we present a detailed derivation of a priori error estimates for several hp-versions of DG-finite element methods for linear diffusion problems (the Poisson problem) on two-dimensional domains. In some cases, important steps in our analysis follows the approach of Rivière, Wheeler, and Girault [20], but other steps differ in detail. We present a series of approaches in which different versions of DGMs, including those with penalty terms, can be analyzed. Our final estimates differ in predicted rates of convergence with respect to the polynomial degree $p$ obtained in [20,19] and reflect rates consistent with the computed results of Baumann [7].

2. Notations and Preliminaries

In the present report, we shall choose the domain $\Omega$ as a bounded open set in $\mathbb{R}^2$, with Lipschitz continuous boundary $\partial \Omega$. We will denote $\Gamma_D$ the part of the boundary $\partial \Omega$ on which Dirichlet conditions are prescribed and $\Gamma_N$ the part on which Neumann conditions are prescribed. Formally, the boundary $\partial \Omega$ is decomposed into the parts $\Gamma_D$ and $\Gamma_N$ such that $\Gamma_D \cup \Gamma_N = \partial \Omega$, and $\Gamma_D \cap \Gamma_N = \emptyset$. 
2.1. Finite Element Partition

Let \( P_h \) denote a partition of the domain \( \Omega \), i.e. \( P_h \) is a finite collection of \( N_v \) open subdomains (elements) \( K_i, i = 1, 2, \ldots, N_v \), such that:

\[
\overline{\Omega} = \bigcup_{K_i \in \mathcal{P}_h} \overline{K_i}, \quad \text{and} \quad K_i \cap K_j = \emptyset, \quad i \neq j.
\]

The size and shape of an element \( K_i \), or simply \( K \), of \( P_h \) are measured in terms of two quantities, \( h_K \) and \( \rho_K \), defined as:

\[
h_K = \text{diam}(K), \quad \rho_K = \sup \{ \text{diam}(B); B \text{ is a ball contained in } K \}.
\]

We also introduce the parameter \( h \) associated with the partition \( P_h \):

\[
h = \max_{K \in \mathcal{P}_h} h_K. \tag{2.1}
\]

**Definition** A family \( \{ P_h \} \) of partitions \( P_h \) is said to be shape regular as \( h \) tends to zero if there exists a number \( \varrho > 0 \), independent of \( h \) and \( K \) such that:

\[
\frac{h_K}{\rho_K} \leq \varrho, \quad \forall K \in \mathcal{P}_h. \tag{2.2}
\]

In this report, all partitions \( P_h \) are assumed to be shape-regular.

In addition, we shall associate with each element \( K \) the element boundary \( \partial K \). The unit normal vector outward from \( K \) (resp. \( K_i \)) is denoted by \( \mathbf{n} \) (resp. \( \mathbf{n}_i \)).

Given a partition \( P_h \), we shall denote the collection of edges of \( P_h \) (points in one dimension, faces in three dimensions) by the set \( \mathcal{E}_h = \{ \gamma_l \}, l = 1, \ldots, N_\gamma \). Edges represent here open subsets of either \( \Omega \) or \( \partial \Omega \). We thus introduce the set \( \Gamma_{\text{int}} \) of interior edges as:

\[
\Gamma_{\text{int}} = \left( \bigcup_{l=1}^{N_\gamma} \gamma_l \right) \setminus \partial \Omega \tag{2.3}
\]

so that:

\[
\bigcup_{l=1}^{N_\gamma} \gamma_l = \Gamma_D \cup \Gamma_N \cup \Gamma_{\text{int}}.
\]

In the same way, we shall decompose \( \mathcal{E}_h \) into three subsets as:

\[
\mathcal{E}_h = \mathcal{E}_{h,D} \cup \mathcal{E}_{h,N} \cup \mathcal{E}_{h,\text{int}}.
\]
Then, $\gamma \in \mathcal{E}_{h,D}$ if it lies on $\Gamma_D$, and $\gamma \in \mathcal{E}_{h,N}$ if it lies on $\Gamma_N$. Moreover, as shown in Fig. 1, $\gamma_{ij} \in \mathcal{E}_{h,\text{int}}$ denotes an edge (interface) between two adjacent elements $K_i$ and $K_j$, where by convention $i > j$. For each edge $\gamma$, we also associate a unit normal vector $n$. In the case $\gamma$ is an edge associated with an element $K_i$ adjacent to $\partial \Omega$, i.e. $\gamma \in \mathcal{E}_{h,D} \cup \mathcal{E}_{h,N}$, the unit normal vector is simply defined as $n = n_i$. For an interior edge $\gamma_{ij} \in \mathcal{E}_{h,\text{int}}$, with the convention $i > j$, $n$ is chosen as the unit normal vector outward from $K_i$, so that $n = n_i = -n_j$ (see Fig. 1). In subsequent analyses, $C$ will denote generic positive constants, not necessarily the same in different places.

Remark 1 Using simple geometrical properties, one can show that each edge $\gamma$ in a shape-regular partition satisfies:

$$\frac{1}{\rho} h_K \leq |\gamma| \leq h_K,$$

where $|\gamma|$ denotes the length of $\gamma$. In other words, $h_K$ and $\gamma$ are equal within a constant. Therefore, we will interchangeably use $h_K$ or $\gamma$ (preferably $h_K$) in this report.

2.2. Spaces

Let $s$ be a positive integer. For any given open set $S$ ($S$ may define the whole domain $\Omega$, an element $K$ of $\mathcal{P}_h$, or an edge $\gamma$ of $\mathcal{E}_h$), the spaces $H^s(S)$ will denote the usual Sobolev spaces with norm $\| \cdot \|_{s,S}$. In the particular case in which $S$ represents $\Omega$, the norm will simply be denoted $\| \cdot \|_{s}$. Moreover, $H^1_0(S)$ is the set of functions in $H^1(S)$ which vanish on the boundary $\partial S$ of $S$, i.e.

$$H^1_0(S) = \{ v \in H^1(S); v = 0 \text{ on } \partial S \},$$
and \( H(\text{div}, S) \) denotes the space:
\[
H(\text{div}, S) = \{ v \in (L^2(S))^2; \nabla \cdot v \in L^2(S) \}.
\]
The so-called (mesh-dependent) broken space \( H^s(\mathcal{P}_h) \) will be defined as:
\[
H^s(\mathcal{P}_h) = \{ v \in L^2(\Omega); v|_K \in H^s(K), \forall K \in \mathcal{P}_h \}.
\]
The norm associated with the space \( H^s(\mathcal{P}_h) \) is given as:
\[
\| v \|_{s, \mathcal{P}_h} = \left( \sum_{K \in \mathcal{P}_h} \| v \|_{s,K}^2 \right)^{1/2}
\]
where \( \| v \|_{s,K} \) is the Sobolev norm on \( K \).

We will consider finite element spaces \( \mathcal{V}^{hp} \) of polynomial functions, possibly discontinuous at the element interfaces, such as:
\[
\mathcal{V}^{hp} = \{ v \in L^2(\Omega); v|_K = \hat{\varphi} \circ F_K^{-1}, \hat{\varphi} \in P_p(\hat{K}), \forall K \in \mathcal{P}_h \}
\]  
(2.5)

where \( F_K \) is the affine mapping from the master element \( \hat{K} \) to the element \( K \) in the partition, and \( P_p(\hat{K}) \) is the space of polynomial functions of degree at most \( p \) on \( \hat{K} \).

In \( hp \) methods, the polynomial degree can actually vary from one element to the other. Denoting \( p_K \) the polynomial degree associated with the element \( K \), we define the global value \( p \) for the partition \( \mathcal{P}_h \) as:
\[
p = \min_{K \in \mathcal{P}_h} p_K.
\]  
(2.6)

One advantage of DGMs over conventional \( hp \) finite element methods is that the polynomial degrees \( p_K \) do not necessarily match at the interfaces of the elements.

3. Formulations for the Poisson Model Problem

3.1. Model Problem

In this report, we shall consider the following Poisson model problem: find the scalar function \( u \) which is the solution of
\[
-\Delta u + cu = f, \quad \text{in } \Omega,
\]  
(3.1)
and which satisfies the boundary conditions:
\[
u = u_0, \quad \text{on } \Gamma_D,
\]
\[
n \cdot \nabla u = g, \quad \text{on } \Gamma_N.
\]  
(3.2)
Here \( f \in L^2(\Omega) \) represents the load scalar and \( c \) is a positive constant over the domain \( \Omega \).

We now proceed with the derivation of weak formulations of the Poisson equation on discontinuous spaces. Let \( u \), for the moment, be a sufficiently smooth function. The regularity of \( u \) shall be discussed later in the report, namely in Subsection 3.3. Multiplying (3.1) by a function \( v \) in \( H^2(\mathcal{T}_h) \) and integrating over the domain \( \Omega \), we obtain:

\[
- \int_{\Omega} (\nabla \cdot \nabla u + cu) \, v \, dx = \int_{\Omega} f v \, dx.
\]

Unlike the classical continuous finite element approach, we shall first decompose the integrals in the above equation into element contributions

\[
\sum_{K \in \mathcal{T}_h} \left( \int_{\Omega} (\nabla \cdot \nabla u) \, v \, dx + \int_{\Omega} cu \, v \, dx \right) = \sum_{K \in \mathcal{T}_h} \int_{\Omega} f v \, dx,
\]

and then integrate by parts, so that:

\[
\sum_{K \in \mathcal{T}_h} \int_{\Omega} (\nabla \cdot \nabla u + cu) \, v \, dx - \sum_{K \in \mathcal{T}_h} \int_{\partial K} (\mathbf{n} \cdot \nabla u) \, v \, ds = \sum_{K \in \mathcal{T}_h} \int_{\Omega} f v \, dx. \tag{3.3}
\]

We observe that the boundary integrals are defined on each element boundary; those are now split according to the type of boundary such as:

\[
\sum_{K \in \mathcal{T}_h} \int_{\partial K} (\mathbf{n} \cdot \nabla u) \, v \, ds = \sum_{\gamma \in \mathcal{E}_{h,D}} \int_{\gamma} (\mathbf{n} \cdot \nabla u) \, v \, ds
\]

\[
+ \sum_{\gamma \in \mathcal{E}_{h,N}} \int_{\gamma} (\mathbf{n} \cdot \nabla u) \, v \, ds
\]

\[
+ \sum_{\gamma_{ij} \in \mathcal{E}_{h,int}} \int_{\gamma_{ij}} (\mathbf{n} \cdot \nabla u)_i \, v_i + (\mathbf{n} \cdot \nabla u)_j \, v_j \, ds.
\]

where \( v_i \) and \( v_j \) denote the restrictions of \( v \) on the elements \( K_i \) and \( K_j \), respectively. In the same way, \( (\mathbf{n} \cdot \nabla u)_i \) and \( (\mathbf{n} \cdot \nabla u)_j \) represent the restrictions of the flux \( \mathbf{n} \cdot \nabla u \) on \( K_i \) and \( K_j \).

In general, except occasionally to avoid confusion, we shall simplify the notation of these boundary integrals, by rewriting them, for instance,

\[
\sum_{\gamma \in \mathcal{E}_{h,D}} \int_{\gamma} (\mathbf{n} \cdot \nabla u) \, v \, ds = \int_{\Gamma_D} (\mathbf{n} \cdot \nabla u) \, v \, ds,
\]

\[
\sum_{\gamma \in \mathcal{E}_{h,N}} \int_{\gamma} (\mathbf{n} \cdot \nabla u) \, v \, ds = \int_{\Gamma_N} (\mathbf{n} \cdot \nabla u) \, v \, ds.
\]
Moreover, the treatment of the interior boundary integrals is as follows. Given an edge \( \gamma_{ij} \in \mathcal{E}_{h,\text{int}} \) shared by two adjacent elements \( K_i \) and \( K_j, i > j \), we first note that:

\[
(n \cdot \nabla u)_i \, v_i + (n \cdot \nabla u)_j \, v_j = n \cdot (\nabla u)_i \, v_i - n \cdot (\nabla u)_j \, v_j,
\]

where \( n \) is now the unit normal vector with respect to the edge \( \gamma_{ij} \) as defined in the previous section. By analogy with the formula below where \( a, b, c \) and \( d \) are real numbers:

\[
ac - bd = \frac{1}{2}(a + b)(c - d) + \frac{1}{2}(a - b)(c + d),
\]

we can write the integrand as:

\[
n \cdot (\nabla u)_i \, v_i - n \cdot (\nabla u)_j \, v_j
= \frac{1}{2} \left( n \cdot (\nabla u)_i + n \cdot (\nabla u)_j \right) (v_i - v_j) + \frac{1}{2} \left( n \cdot (\nabla u)_i - n \cdot (\nabla u)_j \right) (v_i + v_j)
= \langle n \cdot \nabla u \rangle \, [v] + [n \cdot \nabla u] \langle v \rangle.
\]

Here \([v]\) and \(\langle v \rangle\) respectively denote the jump and average of \(v\) on an interior edge \(\gamma_{ij}, i > j\), of any function \(v \in H^s(K_i) \times H^s(K_j), s > 1/2\), i.e.

\[
[v] = v_i - v_j,
\]

\[
\langle v \rangle = \frac{1}{2}(v_i + v_j).
\]

We conveniently extend the definition of \([v]\) and \(\langle v \rangle\), following Chen [9], to an edge \(\gamma\) lying on \(\Gamma_D\) as:

\[
[v] = v,
\]

\[
\langle v \rangle = v.
\]

It allows us to combine the interior and Dirichlet boundary terms in only one integral as:

\[
\sum_{\gamma_{ij} \in \mathcal{E}_{h,\text{int}}} \int_{\gamma_{ij}} (n \cdot \nabla u)_i \, v_i + (n \cdot \nabla u)_j \, v_j \, ds + \sum_{\gamma \in \mathcal{E}_{h,D}} \int_{\gamma} (n \cdot \nabla u) \, v \, ds
= \int_{\Gamma_{\text{int}}} [n \cdot \nabla u] \, [v] + [n \cdot \nabla u] \langle v \rangle \, ds.
\]

**Remark 2** Note that when \(u \in H^2(\Omega)\), the fluxes \([n \cdot \nabla u]\) are continuous almost everywhere in \(\Omega\), which yields

\[
\int_{\Gamma_{\text{int}}} [n \cdot \nabla u] \langle v \rangle \, ds = 0, \quad \forall v \in H^2(\mathcal{D}_h).
\]

(3.5)
Consequently, (3.3) can now be reduced, when \( u \in H^2(\Omega) \) and applying the Neumann boundary condition, to:
\[
\sum_{K \in \mathcal{T}_h} \int_K (\nabla u \cdot \nabla v + cuv) \, dx - \int_{\Gamma_{int} \cup \Gamma_D} \langle \mathbf{n} \cdot \nabla u \rangle [v] \, ds = \sum_{K \in \mathcal{T}_h} \int_K f \, v \, dx + \int_{\Gamma_N} g \, v \, ds.
\]

We introduce the following bilinear form \( B(\cdot, \cdot) \) defined on \( H^2(\mathcal{T}_h) \times H^2(\mathcal{T}_h) \) and the linear form \( L(\cdot) \) defined on \( H^2(\mathcal{T}_h) \) such as:
\[
\begin{align*}
B(u, v) &= \sum_{K \in \mathcal{T}_h} \int_K (\nabla u \cdot \nabla v + cuv) \, dx, \quad (3.6) \\
F(v) &= \sum_{K \in \mathcal{T}_h} \int_K f \, v \, dx + \int_{\Gamma_N} g \, v \, ds. \quad (3.7)
\end{align*}
\]

We also consider the bilinear form \( J(\cdot, \cdot) \) on \( H^2(\mathcal{T}_h) \times H^2(\mathcal{T}_h) \), which incorporates all boundary integrals on \( \Gamma_{int} \) and \( \Gamma_D \), as:
\[
J(u, v) = \int_{\Gamma_{int} \cup \Gamma_D} \langle \mathbf{n} \cdot \nabla u \rangle [v] \, ds. \quad (3.8)
\]

Then, a general discontinuous weak formulation of the Poisson equation reads:
\[
B(u, v) - J(u, v) = F(v), \quad \forall v \in H^2(\mathcal{T}_h). \quad (3.9)
\]

This above variational form constitutes the starting point to derive formulations of various Discontinuous Galerkin Finite Element Methods (concisely, DGMs.)

### 3.2. Weak Formulations and Finite Element Discretizations

All the formulations presented below use the observation that, for \( u \in H^1(\Omega) \cap H^2(\mathcal{T}_h) \), the jump \([u] \) vanishes on each \( \gamma_{ij} \):
\[
\int_{\gamma_{ij}} v \, [u] \, ds = 0, \quad \forall v \in L^2(\gamma_{ij}). \quad (3.10)
\]

It follows that:
\[
\int_{\Gamma_{int}} \langle \mathbf{n} \cdot \nabla v \rangle \, [u] \, ds = 0, \quad \forall v \in H^2(\mathcal{T}_h). \quad (3.11)
\]

Moreover, the Dirichlet boundary condition can be applied in the following weak manner:
\[
\int_{\Gamma_D} (\mathbf{n} \cdot \nabla v) \, u \, ds = \int_{\Gamma_D} (\mathbf{n} \cdot \nabla v) \, u_0 \, ds, \quad \forall v \in H^2(\mathcal{T}_h). \quad (3.12)
\]
Therefore, introducing the linear form $J_0(\cdot)$ defined as:

$$J_0(v) = \int_{\Gamma_D} (n \cdot \nabla v) u_0 \, ds, \quad \forall v \in H^2(\mathcal{P}_h),$$

we observe that, for $u \in H^1(\Omega) \cap H^2(\mathcal{P}_h)$ and $u = u_0$ on $\Gamma_D$,

$$J(v, u) = J_0(v), \quad \forall v \in H^2(\mathcal{P}_h).$$

3.2.1. Global Element Method - GEM

Introducing the bilinear form $B_\cdot(\cdot, \cdot)$, the subscript referring to the fact that we substract the term $J(v, u)$ to the left hand side of (3.9), and the linear form $F_\cdot(\cdot)$

$$B_\cdot(u, v) = B(u, v) - J(u, v) - J(v, u),$$
$$F_\cdot(v) = F(v) - J_0(v),$$

the Global Element Method consists in finding $u$ such that:

$$B_\cdot(u, v) = F_\cdot(v), \quad \forall v \in H^2(\mathcal{P}_h).$$

One advantage of this method is that it defines a symmetric problem. On the other hand, a significant disadvantage is that the bilinear form is not guaranteed to be semi-positive definite. When dealing with time-dependent problems, this could imply that some eigenvalues have negative real parts, causing the formulation to be unconditionally unstable.

The corresponding finite element discretization of the above problem consists in finding $u_h \in \mathcal{V}^{hp}$ such that:

$$B_\cdot(u_h, v) = F_\cdot(v), \quad \forall v \in \mathcal{V}^{hp}.$$

This method was introduced by Delves et al. [11–14] with the particular objective of accelerating convergence of iterative schemes.

3.2.2. Symmetric Interior Penalty Galerkin Method - SIPG

To enforce stability of the discontinuous method, i.e. continuity of the solution at the interface of the elements, penalty terms have been added to the formulation by Arnold [1] and Wheeler [23]. Let us introduce the following penalty terms:

$$J^D(u, v) = \sum_{\gamma \in \mathcal{E}_{h, \text{int}}} \int_{\gamma} \sigma [u] [v] \, ds + \sum_{\gamma \in \mathcal{E}_{h, \Gamma}} \int_{\gamma} \sigma uv \, ds = \int_{\Gamma_{\text{int}} \cup \Gamma_D} \sigma [u] [v] \, ds,$$

and

$$J^D_0(v) = \sum_{\gamma \in \mathcal{E}_{h, \Gamma}} \int_{\gamma} \sigma u_0 v \, ds = \int_{\Gamma_D} \sigma u_0 v \, ds,$$
where $\sigma$ represents the penalty parameter which depends on the length of the edges $\gamma_{ij}$ and $\gamma$ and the polynomial degree used in the elements; namely $\sigma = \sigma(h, p)$. Then the SIPG method is similar to the GEM except for the penalty terms. Indeed, introducing the forms:

\[
\begin{align*}
\mathcal{B}^\sigma(u, v) &= B(u, v) - J(u, v) - J(v, u) + f^\sigma(u, v), \\
\mathcal{F}^\sigma(v) &= F(v) - J_0(v) + J_0^\sigma(v),
\end{align*}
\]  

(3.18)

the Symmetric Interior Penalty Galerkin problem is to find $u$ such that:

\[
\mathcal{B}^\sigma(u, v) = \mathcal{F}^\sigma(v), \quad \forall v \in H^2(\mathcal{P}_h). 
\]  

(3.19)

Note that when $\sigma$ takes on the value zero, we naturally retrieve the GE method.

The finite element analogue of problem (3.19) is to find $u_h \in \mathcal{V}^{hp}$ such that:

\[
\mathcal{B}^\sigma(u_h, v) = \mathcal{F}^\sigma(v), \quad \forall v \in \mathcal{V}^{hp}. 
\]  

(3.20)

**Remark 3** Following Baker and Karakashian [5,6,16], we consider a variant of the SIPG method. Instead of using the formula (3.4), one may use:

\[
ac - bd = ac - ad + ad - bd = a(c - d) + (a - b)d
\]  

(3.21)

so that, by analogy:

\[
n \cdot (\nabla u)_i v_i - n \cdot (\nabla u)_j v_j = n \cdot (\nabla u)_i [v] + [n \cdot \nabla u] v_j
\]

and, since the fluxes, for $u \in H^2(\Omega)$, are continuous across the interelement boundaries, we have:

\[
\int_{\gamma_{ij}} (n \cdot \nabla u)_i v_i + (n \cdot \nabla u)_j v_j \, ds = \int_{\gamma_{ij}} n \cdot (\nabla u)_i [v] \, ds.
\]

The new bilinear form for the boundary terms is now defined as:

\[
I(u, v) = \int_{\Gamma_{in} \cup \Gamma_{D}} n \cdot (\nabla u)_i [v] \, ds
\]

so that the new formulation reads: Find $u \in H^1(\Omega) \cap H^2(\mathcal{P}_h)$ such that, for all $v \in H^2(\mathcal{P}_h)$,

\[
B(u, v) - I(u, v) - I(v, u) + f^\sigma(u, v) = F(v) - J_0(v) + J_0^\sigma(v).
\]  

(3.22)

We now see that we recover the SIPG method from the Baker-Karakashian formulation by replacing the term $n \cdot (\nabla u)_i$ by $\langle n \cdot \nabla u \rangle$. It follows that all the properties associated with the SIPG method will also apply to the Baker-Karakashian formulation.
3.2.3. Discontinuous \( hp \) Galerkin FE Method - DGM

The discontinuous Galerkin method by Baumann et al. \([7,18]\) differs from the Global Element Method by just a sign. Indeed, by introducing the forms:

\[
\mathcal{B}_+(u, v) = B(u, v) - J(u, v) + J(v, u), \\
\mathcal{F}_+(v) = F(v) + J_0(v),
\]

(3.23)

the DG formulation reads: Find \( u \) such that

\[
\mathcal{B}_+(u, v) = \mathcal{F}_+(v), \quad \forall v \in H^2(\mathcal{T}_h).
\]

(3.24)

It is straightforward to show that the bilinear form is positive semidefinite.

The associated finite element version of the DG method consists then in finding \( u_h \in \mathcal{V}_{hp} \) such that

\[
\mathcal{B}_+(u_h, v) = \mathcal{F}_+(v), \quad \forall v \in \mathcal{V}_{hp}.
\]

(3.25)

3.2.4. Non-Symmetric Interior Penalty Galerkin Method - NIPG

This method was introduced by Rivière \([19]\) and Süli, Schwab and Houston \([22,15]\) and is inspired from the DG method with the addition of penalty terms. The new bilinear and linear forms read:

\[
\mathcal{B}_+^\sigma(u, v) = B(u, v) - J(u, v) + J(v, u) + \int_{\mathcal{T}_h} \sigma (u, v), \\
\mathcal{F}_+^\sigma(v) = F(v) + J_0(v) + \int_{\mathcal{T}_h} \sigma (v),
\]

(3.26)

so that the problem to solve by the NIPG method becomes: Find \( u \) such that

\[
\mathcal{B}_+^\sigma(u, v) = \mathcal{F}_+^\sigma(v), \quad \forall v \in H^2(\mathcal{T}_h).
\]

(3.27)

Once again, we may consider DG as a special case of NIPG with \( \sigma = 0 \).

The finite element problem corresponding to the NIPG formulation (3.27) is to find \( u_h \in \mathcal{V}_{hp} \) such that

\[
\mathcal{B}_+^\sigma(u_h, v) = \mathcal{F}_+^\sigma(v), \quad \forall v \in \mathcal{V}_{hp}.
\]

(3.28)

The four methods presented thus far are all very similar, except for a plus or minus sign in front of the term \( J(v, u) \) and the addition of a penalty term \( \int_{\mathcal{T}_h} \sigma (u, v) \) or not. We shall see in the remainder of this report how these changes modify the properties of the respective formulations.
3.3. Equivalence of Strong and Weak Problems

We shall show the equivalence of the strong and weak formulations only with respect to the Global Element method. The results are identical for the other formulations, namely the SIPG, DG and NIPG methods. Existence of solutions of the discontinuous formulations is then somewhat guaranteed. However, we emphasize here that Theorem 3.1 does not infer anything about the uniqueness of the solutions. This question still remains an open issue.

**Theorem 3.1 (GE Method)** Let \( u \in C^2(\Omega) \) be the solution of Problem (3.1)-(3.2). Then \( u \) satisfies the weak formulation (3.16). Conversely, if \( u \in H^1(\Omega) \) is a solution of (3.16) then \( u \) satisfies the partial differential equation (3.1) and boundary conditions (3.2).

**Proof:** The first part of the theorem has been proved along with the derivation of the Global Element formulation, since (3.9) is satisfied when \( u \in C^2(\Omega) \).

The converse follows the proof given in Riviè re [19]. Let \( \mathcal{D}(K) \subset H^2(K) \) be the space of infinitely differentiable functions with compact support on element \( K \) and let \( v \in \mathcal{D}(K) \). Then (3.16) gives:

\[
\int_K (\nabla u \cdot \nabla v + cuv) \, dx = \int_K f v \, dx
\]

which implies, after integration by parts and since \( v \) is arbitrary in \( \mathcal{D}(K) \), that

\[
-\Delta u + cu = f, \quad \text{a.e. in } K. \tag{3.29}
\]

Next, we consider an interior edge \( \gamma_{ij} \) shared by the elements \( K_i \) and \( K_j \). Let \( v \) be a function in \( H^2_0(K_i \cup K_j) \subset H^2(K_i) \times H^2(K_j) \), extended by zero outside. Then the boundary terms \( I(u,v) \) and \( J(v,u) \) vanish, because \( [u] = [v] = 0 \) on \( \gamma_{ij} \), and the weak formulation (3.16) reduces to

\[
\int_{K_i \cup K_j} (\nabla u \cdot \nabla v + cuv) \, dx = \int_{K_i \cup K_j} f v \, dx \tag{3.30}
\]

On the other hand, multiplying (3.29) by \( v \), integrating on \( K_i \) and \( K_j \) and using Green’s formula, we have:

\[
\int_{K_i} (\nabla u \cdot \nabla v + cuv) \, dx - \int_{\gamma_{ij}} (\text{n} \cdot \nabla u) v \, ds = \int_{K_j} f v \, dx,
\]

\[
\int_{K_j} (\nabla u \cdot \nabla v + cuv) \, dx - \int_{\gamma_{ij}} (\text{n} \cdot \nabla u) v \, ds = \int_{K_i} f v \, dx,
\]

so that

\[
\int_{K_i \cup K_j} (\nabla u \cdot \nabla v + cuv) \, dx - \int_{\gamma_{ij}} [\text{n} \cdot \nabla u] v \, ds = \int_{K_i \cup K_j} f v \, dx. \tag{3.31}
\]
Comparing (3.30) and (3.31), one observes that:

$$
\int_{\gamma_{ij}} [n \cdot \nabla u] v \, ds = 0, \quad \forall v \in H^1_0(K_j \cup K_i).
$$

Then, \([n \cdot \nabla u] = 0\) for all element edges \(\gamma_{ij}\), which implies \(\nabla u \in H(\text{div}, \Omega)\). This allows us to conclude that \(u\) satisfies Poisson Equation globally on \(\Omega\), i.e.

$$
-\Delta u + cu = f, \quad \text{a.e. in } \Omega.
$$

(3.32)

To recover the Dirichlet boundary conditions, we now consider a function \(v \in H^1_0(\Omega) \cap H^2(\Omega)\), so that integrating (3.32) provides:

$$
\int_{\Omega} (\nabla u \cdot \nabla v + cuv) \, dx = \int_{\Omega} f v \, dx,
$$

whereas (3.16) yields:

$$
\int_{\Omega} (\nabla u \cdot \nabla v + cuv) \, dx - \int_{\Gamma_D} (n \cdot \nabla v) u \, ds = \int_{\Omega} f v \, dx - \int_{\Gamma_D} (n \cdot \nabla v) u_0 \, ds.
$$

Subtracting both equations, we obtain:

$$
\int_{\Gamma_D} (n \cdot \nabla v) (u - u_0) \, ds = 0, \quad \forall v \in H^1_0(\Omega) \cap H^2(\Omega),
$$

and conclude that \(u = u_0\) on \(\Gamma_D\).

In the same way, choosing \(v \in H^2(\Omega) \subset H^2(P_h)\) such that \(v = 0\) on \(\Gamma_D\), we get:

$$
\int_{\Gamma_N} (n \cdot \nabla u - g) v \, ds = 0,
$$

so that \(n \cdot \nabla u = g\) on \(\Gamma_N\). \(\square\)

**Remark 4** When \(c\) is zero, \(C^2(\Omega)\) can be replaced in Theorem 3.1 by \(H^1(\Omega) \cap H^2(P_h)\) since \(\nabla u \in H(\text{div}, \Omega)\).

### 3.4. Properties of the Bilinear Forms

#### 3.4.1. Mesh-dependent norms

We now introduce norms associated with the bilinear forms:

1. **Energy Norm:**

$$
\|v\|_{E,P_h}^2 = B(v, v) = \sum_{K \in P_h} \|v\|_{P_h,K}^2 = \sum_{K \in P_h} \left( \|\nabla v\|_{0,K}^2 + c \|v\|_{0,K}^2 \right) \quad (3.33)
$$
2. Norm proposed by Süli et al. in [22,15]:
\[ \| v \|_{P_h}^2 = B(v, v) + J^\prime(v, v) = \| v \|_{c,P_h}^2 + \int_{\Gamma_{int} \cup \Gamma_D} \sigma [v]^2 \, ds \] (3.34)

3. Norm proposed by Baumann et al.in [7,17,18] and by Baker and Karakashian in [6]:
\[ \| v \|_{P_h}^2 = \| v \|_{P_h}^2 + \int_{\Gamma_{int} \cup \Gamma_D} \frac{1}{\sigma} \langle n \cdot \nabla v \rangle^2 \, ds \] (3.35)

We note that the energy norm becomes a seminorm when \( c \) is zero.

### 3.4.2. Continuity of the bilinear forms

We shall show now that the bilinear forms \( B_\pm(\cdot, \cdot) \) and \( P_\pm(\cdot, \cdot) \) are continuous on \( H^2(P_h) \) with respect to the norm \( \| \cdot \|_{P_h} \) defined in (3.35). Unfortunately, we are unable to show continuity with respect to the other two norms (3.33) and (3.34).

**Theorem 3.2 (GEM and DGM)** Let \( B_\pm(\cdot, \cdot) \) be the bilinear form defined either in (3.15) or in (3.23). Then,
\[ |B_\pm(u, v)| \leq \| u \|_{P_h} \| v \|_{P_h}, \quad \forall u, \forall v \in H^2(P_h). \] (3.36)

**Proof:**

First note that:
\[ |B_\pm(u, v)| = |B(u, v) - J(u, v) \pm J(v, u)| \leq |B(u, v)| + |J(u, v)| + |J(v, u)| \]

It is clear that
\[ |B(u, v)| \leq \sum_{k \in P_h} \int_{K} |\nabla u \cdot \nabla v + cuv| \, dx \leq \| u \|_{c,P_h} \| v \|_{c,P_h} \]

The first boundary term gives:
\[ |J(u, v)| \leq \int_{\Gamma_{int} \cup \Gamma_D} |\langle n \cdot \nabla u \rangle [v]| \, ds \leq \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} \sigma^{-1} \langle n \cdot \nabla u \rangle^2 \, ds} \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} \sigma [v]^2 \, ds}. \]

Likewise,
\[ |J(v, u)| \leq \int_{\Gamma_{int} \cup \Gamma_D} |\langle n \cdot \nabla v \rangle [u]| \, ds \leq \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} \sigma [u]^2 \, ds} \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} \sigma^{-1} \langle n \cdot \nabla v \rangle^2 \, ds}. \]
In consequence, we have, using the discrete Schwarz inequality (A.1):

\[
|B_{\pm}(u, v)| \leq \|u\|_{e, p_h} \|v\|_{e, p_h} \\
+ \sqrt{\int_{\Gamma_D} \sigma^{-1} (\mathbf{n} \cdot \nabla u)^2 \, ds} \sqrt{\int_{\Gamma_D} \sigma \|v\|^2 \, ds} \\
+ \sqrt{\int_{\Gamma_D} \sigma |u|^2 \, ds} \sqrt{\int_{\Gamma_D} \sigma^{-1} (\mathbf{n} \cdot \nabla v)^2 \, ds}.
\]

\[
\leq \sqrt{\|u\|^2_{e, p_h} + \int_{\Gamma_D} \sigma |u|^2 \, ds + \int_{\Gamma_D} \sigma^{-1} (\mathbf{n} \cdot \nabla u)^2 \, ds} \\
\times \sqrt{\|v\|^2_{e, p_h} + \int_{\Gamma_D} \sigma |v|^2 \, ds + \int_{\Gamma_D} \sigma^{-1} (\mathbf{n} \cdot \nabla v)^2 \, ds}.
\]

\[
\leq \|u\|_{p_h} \|v\|_{p_h},
\]

which completes the proof. □

**Theorem 3.3 (SIPG and NIPG Methods)** Let \( B_{\pm}(\cdot, \cdot) \) be the bilinear form defined either in (3.18) or in (3.26). Then,

\[
|B_{\pm}(u, v)| \leq C \|u\|_{p_h} \|v\|_{p_h}, \quad \forall u, \forall v \in H^2(p_h).
\]

(3.37)

where C is a constant, \( C \leq 2 \).

**Proof:**

As before we have:

\[
|B_{\pm}^B(u, v)| = |B(u, v) - J(u, v) \pm J(v, u) + J'(u, v)|
\]

\[
\leq |B(u, v)| + |J(u, v)| + |J(v, u)| + |J'(u, v)|
\]

\[
\leq \|u\|_{p_h} \|v\|_{p_h} + |J'(u, v)|.
\]

And

\[
|J'(u, v)| \leq \int_{\Gamma_D} |\sigma[u][v]| \, ds \leq \sqrt{\int_{\Gamma_D} \sigma |u|^2 \, ds} \sqrt{\int_{\Gamma_D} \sigma |v|^2 \, ds}.
\]

Therefore, making use again of the discrete Schwarz inequality (A.1), we obtain:

\[
|B_{\pm}^B(u, v)| \leq \|u\|_{p_h} \|v\|_{p_h} + \int_{\Gamma_D} \sigma |u|^2 \, ds \sqrt{\int_{\Gamma_D} \sigma |v|^2 \, ds}.
\]

\[
\leq \sqrt{\|u\|^2_{p_h} + \int_{\Gamma_D} \sigma |u|^2 \, ds} \sqrt{\|v\|^2_{p_h} + \int_{\Gamma_D} \sigma |v|^2 \, ds}.
\]

\[
\leq 2 \|u\|_{p_h} \|v\|_{p_h},
\]

and we see that C is at most equal to 2. □
3.4.3. Coercivity of the bilinear forms in the discrete spaces

Here we wish to show that the bilinear forms $B_{\pm}(\cdot, \cdot)$ and $B_{\pm}^r(\cdot, \cdot)$ are coercive in $H^2(\mathcal{P}_h)$ with respect to the norm $\|\cdot\|_{H^2}$ in order to be able to apply classical theorems for existence and uniqueness of solutions of the discontinuous methods. Unfortunately, to date, we are able to prove coercivity only in the discrete discontinuous spaces $\mathcal{V}^{hp}$, and then, only for the SIPG and NIPG formulations.

**Theorem 3.4 (NIPG Method)**  Let $\sigma = \kappa p^2/h$, $\kappa$ being a positive number. Then, for all $\kappa > 0$, there exists a positive constant, $\alpha > 0$, such that:

$$B_{\pm}^r(z, z) \geq \alpha \|z\|_{H^2}^2, \quad \forall z \in \mathcal{V}^{hp}. \quad (3.38)$$

Here $\alpha$ is independent of $h$ and $p$.

**Proof:** Let $\alpha$ be an arbitrary real number and choose $z \in \mathcal{V}^{hp}$. Then

$$B_{\pm}^r(z, z) - \alpha \|z\|_{H^2}^2$$

$$= (1 - \alpha) B(z, z) + (1 - \alpha) J^r(z, z) - \alpha \int_{\Gamma_{int} \cup \Gamma_D} \frac{1}{\sigma} \langle n \cdot \nabla z \rangle^2 \, ds$$

Since $\langle n \cdot \nabla z \rangle$ is the average of the flux at the interface of two elements $K_i$ and $K_j$, the corresponding integral can be split into two integrals with integrands $(n \cdot \nabla z)_i/\sigma$ and $(n \cdot \nabla z)_j/\sigma$, each one associated with the elements $K_i$ or $K_j$ respectively. Therefore, let $\gamma \subset \Gamma_{int} \cup \Gamma_D$ and consider the integral associated with the element $K$. Using the trace inequality (A.3) and the inverse property (A.7), we have

$$\int_\gamma \frac{1}{\sigma} \langle n \cdot \nabla z \rangle^2 \, ds \leq \frac{1}{\sigma} \|\nabla z\|_{0, \gamma}^2$$

$$\leq \frac{C}{\sigma} \left( \frac{1}{h_K} \|\nabla z\|_{0,K}^2 + \|\nabla z\|_{0,K} \|\nabla^2 z\|_{0,K} \right)$$

$$\leq \frac{C}{\sigma} \left( \frac{1}{h_K} + C_0 \frac{p_K^2}{h_K} \right) \|\nabla z\|_{0,K}^2$$

$$\leq \frac{C}{\sigma} \frac{p_K^2}{h_K} \|\nabla z\|_{0,K}^2,$$

so that, selecting $\sigma$ to be equal to $\kappa p_K^2/h_K$, we obtain:

$$- \int_\Gamma \frac{1}{\sigma} \langle n \cdot \nabla z \rangle^2 \, ds \geq - \frac{C}{\kappa} \|\nabla z\|_{0,K}^2.$$

Note that, when the mesh size $h_{K_i}$ and $h_{K_j}$ and the polynomial degrees $p_{K_i}$ and $p_{K_j}$ are different from each other in the two elements $K_i$ and $K_j$ sharing the edge $\gamma_{ij}$, we
actually choose $\sigma$ as
\[ \sigma = \kappa \frac{\max(p_{K_i}^2, p_{K_j}^2)}{\min(h_{K_i}, h_{K_j})}, \]
so that:
\[
\int_\gamma \frac{1}{\sigma} (n \cdot \nabla z)^2 \, ds \leq \frac{C}{\kappa} \frac{p_{K_i}^2}{h_{K_i}} \| \nabla z \|_{0, K_i}^2
\]
\[
\leq \frac{C}{\kappa} \max(p_{K_i}^2, p_{K_j}^2) \frac{p_{K_i}^2}{h_{K_i}} \| \nabla z \|_{0, K_i}^2
\]
\[
\leq \frac{C}{\kappa} \| \nabla z \|_{0, K_i}^2.
\]
It then follows that:
\[
\mathcal{B}_n^e(z, z) - \alpha \| z \|_{V_h}^2 \geq (1 - \alpha - \alpha C/\kappa) B(z, z) + (1 - \alpha) f^e(z, z).
\]
Therefore, we certainly can pick a value of $\alpha$ such that
\[
0 < \alpha \leq \frac{1}{1 + C/\kappa}
\]
for which the bilinear form $\mathcal{B}_n^e(\cdot, \cdot)$ is coercive in $V^{hp}$, for all $\kappa > 0$. \qed

**Theorem 3.5 (SIPG Method)** Let $\sigma = \kappa p^2/h$, $\kappa$ being a positive number. Then, for $\kappa > \kappa_0$, there exists a positive constant $\alpha$ independent of $h$ and $p$, $\alpha > 0$, such that:
\[
\mathcal{B}_n^e(z, z) \geq \alpha \| z \|_{V_h}^2, \quad \forall z \in V^{hp}.
\tag{3.39}
\]

**Proof:** Let $\alpha$ be an arbitrary real number and choose $z \in V^{hp}$. Then
\[
\mathcal{B}_n^e(z, z) - \alpha \| z \|_{V_h}^2 = (1 - \alpha) B(z, z) + (1 - \alpha) f^e(z, z)
\]
\[
- 2 \int_{\Gamma_{int} \cup \Gamma_D} \langle n \cdot \nabla z \rangle [z] \, ds - \alpha \int_{\Gamma_{int} \cup \Gamma_D} \frac{1}{\sigma} \langle n \cdot \nabla z \rangle^2 \, ds
\]
There exists a positive number $\varepsilon$ such that for every edge $\gamma \in \Gamma_{int} \cup \Gamma_D$:
\[
2 \int_\gamma \langle n \cdot \nabla z \rangle [z] \, ds \leq 2 \sqrt{\int_\gamma \sigma^{-1} \langle n \cdot \nabla z \rangle^2 \, ds} \sqrt{\int_\gamma \sigma [z]^2 \, ds}
\]
\[
\leq \varepsilon \int_\gamma \frac{1}{\sigma} \langle n \cdot \nabla z \rangle^2 \, ds + \frac{1}{\varepsilon} \int_\gamma \sigma [z]^2 \, ds
\]
which yields, using the result in the previous proof:

\[ B_h^\infty(z, z) - \alpha \| z \|_{P_h}^2 \geq \left( 1 - \alpha - (\alpha + \varepsilon) \frac{C}{K} \right) B(z, z) + \left( 1 - \alpha - \frac{1}{\varepsilon} \right) f'(z, z). \]

In order to prove coercivity, we want to find \( \alpha > 0 \) such that both factors in the inequality are positive, in other words:

\[ \left( 1 - \alpha - (\alpha + \varepsilon) \frac{C}{K} \right) > 0 \quad \text{and} \quad \left( 1 - \alpha - \frac{1}{\varepsilon} \right) > 0. \]

The second inequality requires that:

\[ 0 < \alpha \leq 1 - \frac{1}{\varepsilon} \]

which means that

\[ \varepsilon > 1. \]

On the other hand the first inequality requires that:

\[ 0 < \alpha \leq \frac{1 - \varepsilon C/K}{1 + C/K} \leq \frac{1 - C/K}{1 + C/K} \leq \frac{K - C}{K + C} \]

This completes the proof by taking \( K \) sufficiently large, namely \( K \geq K_0 \) (where for instance \( K_0 > C \)). \( \square \)

**Remark 5** We note that \( B_h^\infty(\cdot, \cdot) \) (for NIPG Method) is coercive in \( H^2(P_h) \) with respect to the norm \( \| \cdot \|_{P_h} \). Indeed, for all \( v \in H^2(P_h) \),

\[ B_h^\infty(v, v) = B(v, v) - J(v, v) + J(v, v) + f'(v, v) = \| v \|_{P_h}^2. \] \hspace{1cm} (3.40)

It is also straightforward to show that \( B_h(\cdot, \cdot) \) (for DGM) is coercive in \( H^2(P_h) \) with respect to the energy norm \( \| \cdot \|_{e,P_h} \):

\[ B_h(v, v) = B(v, v) - J(v, v) + J(v, v) = \| v \|_{e,P_h}^2. \] \hspace{1cm} (3.41)

These results will be crucial in deriving a priori error estimates in the next section.

## 4. A Priori Error Estimates

### 4.1. SIPG and NIPG Methods

**Theorem 4.1** Let \( u \in H^1(\Omega) \cap H^s(P_h) \), \( s \geq 2 \), be a solution of (3.18) (SIPG) or (3.26) (NIPG) and \( u_h \) be the discrete discontinuous solution of

\[ B_h^\infty(u_h, v) = f(v), \quad \forall v \in V^{hp}. \] \hspace{1cm} (4.1)
Then, choosing $\sigma = \kappa p^2 / h$, ($\kappa > 0$ for NIPG and $\kappa \geq \kappa_0$ for SIPG), the numerical error $e = u - u_h$ satisfies:

$$\|e\|_{\mathcal{E},\mathcal{D}_h} \leq C \frac{h^{\mu-1}}{p^{\nu-3/2}} \|u\|_s$$

(4.2)

where $\mu = \min(p+1, s)$ and $p \geq 1$.

4.1.1. Proof of Theorem 4.1 for SIPG and NIPG

First, by definition of the norms, we note that $\|e\|_{\mathcal{E},\mathcal{D}_h} \leq \|e\|_{\mathcal{D}_h}$. In other words, it suffices here to estimate the error with respect to the norm $\| \cdot \|_{\mathcal{D}_h}$. The proof is inspired by [5,6,16] where the authors have derived the rate of convergence in $h$ only for the SIPG method of the (3.22) form. Here we extend their results to the NIPG formulation as well and also show for both methods the rate of convergence in $p$.

Proof: Let $z_p$ be an interpolant of $u$ in $V^{hp}$. We shall use the notation $\eta = u - z_p$ and $\xi = u_h - z_p$ so that $e = u - u_h = \eta - \xi$. Applying the triangle inequality, we have:

$$\|e\|_{\mathcal{D}_h} = \|u - u_h\|_{\mathcal{D}_h} = \|\eta - \xi\|_{\mathcal{D}_h} \leq \|\eta\|_{\mathcal{D}_h} + \|\xi\|_{\mathcal{D}_h}.$$  

From the coercivity of the bilinear form $B^\sigma_\pm (\cdot, \cdot)$, since $\xi \in V^{hp}$, we have

$$\|\xi\|_{\mathcal{D}_h}^2 \leq CB^\sigma_\pm (\xi, \xi),$$

and from the “orthogonality” property $B^\sigma_\pm (u - u_h, v) = 0$, $\forall v \in V^{hp}$, we get

$$B^\sigma_\pm (\eta, \xi) = B^\sigma_\pm (\eta, \xi), \quad \forall v \in V^{hp}.$$

Using the continuity of $B^\sigma_\pm (\cdot, \cdot)$, we know that

$$B^\sigma_\pm (\eta, \xi) \leq C \|\eta\|_{\mathcal{D}_h} \|\xi\|_{\mathcal{D}_h},$$

which implies

$$\|\xi\|_{\mathcal{D}_h} \leq C \|\eta\|_{\mathcal{D}_h}.$$  

Finally, we have

$$\|e\|_{\mathcal{D}_h} \leq \|\eta\|_{\mathcal{D}_h} + \|\xi\|_{\mathcal{D}_h} \leq C \|\eta\|_{\mathcal{D}_h},$$

We recall here that $C$ is a generic constant independent of $h$ and $p$ which takes different values at different places.
We now choose the interpolant $z_p$ as defined in Lemma A.7. Then:

$$\|\eta\|^2_{q_h} = \sum_{K \in \mathcal{D}_h} \int_K \left( |\nabla \eta|^2 + c\eta^2 \right) \, dx + \int_{\Gamma_{\text{int}}} \int_{\Gamma_{\text{D}}} \frac{1}{\sigma} \langle \mathbf{n} \cdot \nabla \eta \rangle^2 \, ds + \int_{\Gamma_{\text{int}}} \int_{\Gamma_{\text{D}}} \sigma |\eta|^2 \, ds$$  

(4.3)

The integrals in the leading term are estimated as, using (A.8):

$$\int_K |\nabla \eta|^2 \, dx \leq C \left( \frac{h^{p-1}_K}{p^2_K} \right)^2 \|u\|^2_{s,K}, \quad s \geq 1,$$

$$\int_K c\eta^2 \, dx \leq cC \left( \frac{h^2_K}{p^2_K} \right)^2 \|u\|^2_{s,K}, \quad s \geq 0,$$

so that

$$\int_K \left( |\nabla \eta|^2 + c\eta^2 \right) \, dx \leq C \frac{h^{2p-2}_K}{p^{2s-2}_K} \|u\|^2_{s,K}, \quad s \geq 1.$$

Let $\gamma_{ij}$ denote an interior edge shared by the elements $K_i$ and $K_j$. Then, using the inequality $(a + b)^2 \leq 2a^2 + 2b^2$, we observe that

$$\int_{\gamma_{ij}} \frac{1}{\sigma} \langle \mathbf{n} \cdot \nabla \eta \rangle^2 \, ds \leq \frac{1}{2} \int_{\gamma_{ij}} \frac{1}{\sigma} \left( \mathbf{n} \cdot (\nabla \eta) \right)^2 \, ds + \frac{1}{2} \int_{\gamma_{ij}} \frac{1}{\sigma} \left( \mathbf{n} \cdot (\nabla \eta) \right)^2 \, ds.$$

In other words, in splitting the second integrals on the right hand side of (4.3) as above, we actually associate with each $\gamma_{ij} \in \mathcal{E}_{h,\text{int}} \cup \mathcal{E}_{h,\text{D}}$ an element $K$, such that

$$\int_{\gamma_{ij}} \frac{1}{\sigma} \langle \mathbf{n} \cdot \nabla \eta \rangle^2 \, ds \leq \frac{1}{\sigma} \|\nabla \eta\|^2_{0,\gamma}$$

$$\leq \frac{C}{\sigma} \left( \frac{1}{h_K} \|\nabla \eta\|^2_{0,K} + \|\nabla \eta\|_{0,K} \|\nabla^2 \eta\|_{0,K} \right)$$

$$\leq \frac{C}{\sigma} \left( \frac{1}{h_K} \|\eta\|^2_{1,K} + \|\eta\|_{1,K} \|\eta\|_{2,K} \right)$$

$$\leq \frac{C}{\sigma} \left( \frac{h^{2\mu-2}_K}{p^{2s-2}_K} + \frac{h^{2\mu-3}_K}{p^{2s-3}_K} \right) \|u\|^2_{s,K}$$

$$\leq \frac{C}{\sigma} \left( \frac{h^{2\mu-3}_K}{p^{2s-3}_K} \right) \|u\|^2_{s,K}$$

$$\leq \frac{C}{\sigma} \left( \frac{h^{2\mu-2}_K}{p^{2s-2}_K} \right) \|u\|^2_{s,K}, \quad s \geq 2.$$
Again, for an interior edge $\gamma_{ij}$ shared by $K_i$ and $K_j$, using $(a - b)^2 \leq 2a^2 + 2b^2$, we have:

$$\int_{\gamma_{ij}} \sigma [\eta]^2 \, ds = \int_{\gamma_{ij}} \sigma (\eta_i - \eta_j)^2 \, ds \leq 2 \int_{\gamma_{ij}} \sigma (\eta_i)^2 \, ds + 2 \int_{\gamma_{ij}} \sigma (\eta_j)^2 \, ds$$

This means that the edge integrals making the third term of (4.3) are bounded by:

$$\int_{\gamma} \sigma (\eta)^2 \, ds \leq C \sigma \frac{h_{K}^{2\mu - 1}}{p_{K}^{2\alpha - 1}} \| u \|_{s,K}^2 \leq C \sigma \frac{h_{K}^{2\mu - 2}}{p_{K}^{2\alpha - 2}} \| u \|_{s,K}^2$$

In combining the above results, we thus obtain

$$\| \epsilon \|_{\mathcal{Q}} \leq C \| \eta \|_{\mathcal{Q}} \leq C \sum_{K \in \mathcal{T}_h} \left\{ \frac{h_{K}^{2\mu - 2}}{p_{K}^{2\alpha - 2}} + \frac{h_{K}^{2\mu - 2}}{p_{K}^{2\alpha - 2}} + \frac{h_{K}^{2\mu - 2}}{p_{K}^{2\alpha - 2}} \right\} \| u \|_{s,K}^{1/2} \leq C \sum_{K \in \mathcal{T}_h} \frac{h_{K}^{2\mu - 1}}{p_{K}^{s-3/2}} \| u \|_{s,K}$$

which is the expected a priori error estimate.

\[ \square \]

4.1.2. Alternative Proof of Theorem 4.1 for NIPG

Alternatively, we present a second proof of Theorem 4.1 for the NIPG method only as it is based on the nonsymmetry of the formulation. The proof is inspired by the one found in [22]. However, our rate of convergence with respect to $p$ was improved from $(s - 2)$ to $(s - 3/2)$ using the interpolation estimates of Lemma A.7.

Later, the same authors proposed in [15] a comparable version of the proof with $(s - 3/2)$ as the rate of convergence.

**Proof:** Once again, $z_p$ is the interpolant of $u$ in $V^{hp}$ as defined in Lemma A.7. and we denote $\eta = u - z_p$ and $\xi = u_h - z_p$ as before. Then,

$$\| \epsilon \|_{\mathcal{Q}} \leq \| \eta \|_{\mathcal{Q}} = \| u - u_h \|_{\mathcal{Q}} = \| \eta - \xi \|_{\mathcal{Q}} \leq \| \eta \|_{\mathcal{Q}} + \| \xi \|_{\mathcal{Q}}.$$

Moreover, from the definition of $B_{+}^{\sigma}(\cdot, \cdot)$ and the norm $\| \cdot \|_{\mathcal{Q}}$ (see (3.40)) and the “orthogonality” relation, we have:

$$\| \xi \|_{\mathcal{Q}}^2 = B_{+}^{\sigma}(\xi, \xi) = B_{+}^{\sigma}(\eta, \xi).$$

The goal is now to bound $B_{+}^{\sigma}(\eta, \xi)$ in terms of $\| \xi \|_{\mathcal{Q}}$. Recall that:

$$B_{+}^{\sigma}(\eta, \xi) = B(\eta, \xi) + J^{\sigma}(\eta, \xi) - J(\eta, \xi) + J(\xi, \eta) \leq |B(\eta, \xi)| + |J^{\sigma}(\eta, \xi)| + |J(\eta, \xi)| + |J(\xi, \eta)|.$$
The first term on the right hand side of the equation above gives:

\[ |B(\eta, \xi)| \leq \sum_{K \in \mathcal{T}_h} \int_{\Gamma_D} |\nabla \eta \cdot \nabla \xi + c \eta \xi| \, dx \leq \| \eta \|_{c, \mathcal{T}_h} \| \xi \|_{c, \mathcal{T}_h} \leq \| \eta \|_{\mathcal{P}_h} \| \xi \|_{\mathcal{P}_h}. \]

The term \(|f(\eta, \xi)|\) is bounded by:

\[ |f(\eta, \xi)| \leq \int_{\Gamma_0} \left| \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \| \xi \| \right| \, ds \leq \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \, ds} \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \xi}{\sqrt{\bar{\nabla} \sigma}} \, ds} \leq \| \eta \|_{\mathcal{P}_h} \| \xi \|_{\mathcal{P}_h}, \]

whereas we have for the third term:

\[ |J(\eta, \xi)| \leq \int_{\Gamma_0} \left| \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \| \xi \| \right| \, ds \leq \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \, ds} \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \xi}{\sqrt{\bar{\nabla} \sigma}} \, ds} \leq \| \eta \|_{\mathcal{P}_h} \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \, ds}. \]

Likewise, \(J(\xi, \eta)\) is bounded by:

\[ |J(\xi, \eta)| \leq \| \eta \|_{\mathcal{P}_h} \sqrt{\int_{\Gamma_0} \frac{\bar{\sigma} \eta}{\sqrt{\bar{\nabla} \sigma}} \, ds}. \]

Using again the trace inequality (A.3) and the inverse property (A.7), it is shown that:

\[ \int_{\Gamma_0} \frac{1}{\sigma} (\nabla \eta)^2 \, ds \leq \frac{C \rho_0^2}{\sigma h_K} \| \nabla \xi \|_{0, K}^2, \]

In other words, using \(\sigma = \kappa \rho_0^2 / h_K\)

\[ |J(\xi, \eta)| \leq C \| \eta \|_{\mathcal{P}_h} \| \xi \|_{\mathcal{P}_h}. \]

Combining the above results, we have:

\[ \| \xi \|_{\mathcal{P}_h} \leq C \left( \| \eta \|_{\mathcal{P}_h} + \sqrt{\int_{\Gamma_0} \frac{1}{\sigma} (\nabla \eta)^2 \, ds} \right) \leq C \| \eta \|_{\mathcal{P}_h}, \]

so that:

\[ \| \xi \|_{\mathcal{P}_h} \leq \| \xi \|_{\mathcal{P}_h} \leq \| \eta \|_{\mathcal{P}_h} + \| \xi \|_{\mathcal{P}_h} \leq \| \eta \|_{\mathcal{P}_h} + C \| \eta \|_{\mathcal{P}_h} \leq C \| \eta \|_{\mathcal{P}_h}. \]

We conclude the proof by employing the estimate on \(\| \eta \|_{\mathcal{P}_h}\) shown in the previous proof. \(\square\)
4.2. DG Method

We recall that the DG formulation proposed in [7,18] is deduced from the NIPG method by simply setting the penalty parameter $\beta$ to zero. However, unlike NIPG, continuity and coercivity of the bilinear form $B_+$ cannot be proved simultaneously using the same norm. At best it is shown that:

$$B(v, v) = \| v \|_{L_2}^2, \quad \forall v \in H^2(\mathcal{P}_h),$$

and that:

$$B_+(u, v) \leq \| u \|_{L_2} \| v \|_{L_2}, \quad \forall u, v \in H^2(\mathcal{P}_h).$$

The main issue in finding a priori error estimates for the error $e = u - u_h$ in the numerical approximation $u_h$ of the DG problem consists in deriving an upper bound on:

$$\sqrt{\int_{\Gamma_i \cup \Gamma_D} [\xi]^2 ds}$$

with respect to the norm $\| \xi \|_{L_2}$ when $c = 0$. This integral does indeed appear when bounding the term $J(\eta, \xi)$, i.e.

$$|J(\eta, \xi)| \leq \int_{\Gamma_i \cup \Gamma_D} \langle n \cdot \nabla \eta \rangle |\xi| ds \leq \sqrt{\int_{\Gamma_i \cup \Gamma_D} \langle n \cdot \nabla \eta \rangle^2 ds} \sqrt{\int_{\Gamma_i \cup \Gamma_D} [\xi]^2 ds}.$$

We present below two approaches, by treating separately the case when $c$ is zero and the case when $c$ is nonzero.

4.2.1. A priori error estimate when $c$ is nonzero

We find it instructive to analyze the special case in which $c$ is strictly greater than zero. In this case, we still can use the methodology presented earlier for the NIPG method. However, we shall see that the rate of convergence with respect to the mesh size becomes suboptimal as stated in the following theorem.

**Theorem 4.2** Let $u \in H^1(\Omega) \cap H^s(\mathcal{P}_h), s \geq 2$, be a solution of (3.23) with $c > 0$ and $u_h$ be the discrete discontinuous solution of (3.24). Then, the numerical error $e = u - u_h$ satisfies:

$$\| e \|_{L_2} \leq C \frac{h^{s-2}}{p^{s-3/2}} \| u \|_s \quad (4.4)$$

where $\mu = \min(p + 1, s)$ and $p \geq 1$.

**Proof:** Using the same procedure and notation as before, we have:

$$\| e \|_{L_2} = \| u - u_h \|_{L_2} = \| \eta - \xi \|_{L_2} \leq \| \eta \|_{L_2} + \| \xi \|_{L_2}.$$
Moreover, from the definition of $B_+(\cdot, \cdot)$ (see (3.41)) and the “orthogonality” relation, we further show that:

$$\|\xi\|_{e, a_h}^2 = B_+ (\xi, \xi)$$
$$= B_+ (\eta, \xi)$$
$$= B (\eta, \xi) - J (\eta, \xi) + J (\xi, \eta)$$
$$\leq |B (\eta, \xi)| + |J (\eta, \xi)| + |J (\xi, \eta)|$$

We now consider each term one at a time. The first term $B (\eta, \xi)$ is straightforwardly bounded by:

$$|B (\eta, \xi)| \leq \|\eta\|_{e, a_h} \|\xi\|_{e, a_h} \leq C \frac{h^{\mu-1}}{p^{\mu-1}} \|u\|_{s} \|\xi\|_{e, a_h} \tag{4.5}$$

We expect that the third term $J (\xi, \eta)$ can be treated as before and should not pose any problems. Indeed, applying the Cauchy-Schwarz inequality, we have:

$$|J (\xi, \eta)| \leq \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} (n \cdot \nabla \xi)^2 \, ds} \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} [\eta]^2 \, ds}$$

When $\gamma \subset \Gamma_{int} \cup \Gamma_D$ and $\xi \in V^{hp} (K)$, we have already shown that:

$$\int_{\gamma} (n \cdot \nabla \xi)^2 \, ds \leq C \frac{p^2}{h^2} \|\nabla \xi\|^2_{0, K}.$$

Next, we obtain from the approximation property (A.9)

$$\int_{\gamma} \eta^2 \, ds = \|\eta\|^2_{0, \gamma} \leq C \frac{h^{2\mu-1}}{p^{2\mu-1}} \|u\|^2_{s, K}.$$

Therefore the term $J (\xi, \eta)$ is bounded by:

$$|J (\xi, \eta)| \leq C \frac{h^{\mu-1}}{p^{\mu-3/2}} \|u\|_{s} \|\xi\|_{e, a_h}.$$

Finally we need to consider the term $J (\eta, \xi)$, which is held responsible for deteriorating the convergence rate of the solution. By the Cauchy-Schwarz inequality, we have:

$$|J (\eta, \xi)| \leq \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} (n \cdot \nabla \eta)^2 \, ds} \sqrt{\int_{\Gamma_{int} \cup \Gamma_D} [\xi]^2 \, ds}$$

Once again, the approximation property gives

$$\int_{\gamma} (n \cdot \nabla \eta)^2 \, ds \leq C \frac{h^{2\mu-3}}{p^{2\mu-3}} \|u\|^2_{s, K}$$
while from the trace inequality (A.3), we have:

\[
\|\xi\|^2_{0,\gamma} \leq C \left( \frac{1}{h_K^2} \|\xi\|^2_{0,K} + \|\xi\|_{0,K} \|\nabla\xi\|_{0,K} \right) \\
\leq C \left( \frac{1}{h_K^2} \|\xi\|^2_{0,K} + \frac{1}{h_K} \|\xi\|^2_{0,K} + h_K \|\nabla\xi\|^2_{0,K} \right) \\
\leq C \left( \frac{1}{h_K} \|\xi\|^2_{0,K} + h_K \|\nabla\xi\|^2_{0,K} \right) \\
\leq C \left( \frac{1}{ch_K} \|\xi\|^2_{0,K} + h_K \|\nabla\xi\|^2_{0,K} \right) \\
\leq \frac{C}{ch_K} \|\xi\|^2_{0,K}.
\]

(4.6)

It is important to point out here that the norm \(\|\xi\|_{0,\gamma}\) is bounded as long as \(c > 0\). Then we have:

\[
|J(\eta, \xi)| \leq C \frac{h^\mu - 2}{p^s - 3/2} \|u\|_s \|\xi\|_{c,\mathcal{A}_h}.
\]

In conclusion,

\[
\|\xi\|_{c,\mathcal{A}_h} \leq C \left( \frac{h^\mu - 1}{p^s - 1} + \frac{h^\mu - 1}{p^s - 3/2} + \frac{h^2}{p^s - 3/2} \right) \|u\|_s \leq C \frac{h^\mu - 2}{p^s - 3/2} \|u\|_s
\]

which completes the proof. \(\square\)

**Remark 6** Note that \(C\) is inversely proportional to \(c\). Therefore the error is expected to grow as \(c\) gets smaller.

### 4.2.2. Discussion of the case in which \(c\) is zero

The operator, when \(c\) is zero, reduces to the pure Laplacian. In this case, the energy norm \(\|\cdot\|_{c,\mathcal{A}_h}\) becomes the seminorm \(\|\nabla\cdot\|_{0,\mathcal{A}_h}\). Following the same procedure as before, we would have:

\[
\|\nabla\xi\|^2_{0,\mathcal{A}_h} = \mathcal{B}_+(\xi, \xi) = \mathcal{B}_+(\eta, \xi) \quad (4.7)
\]

where \(\eta = u - z_p, \xi = u_h - z_p\) and \(z_p\) defines an arbitrary interpolant of \(u\) on \(\mathcal{V}^{hp}\). However, from (4.6), we can see right now that the term \(\mathcal{B}_+(\eta, \xi)\) would then be bounded by \(\|\xi\|_{0,\mathcal{A}_h}\). In turn, it is impossible to bound \(\|\xi\|_{0,\mathcal{A}_h}\) with respect to \(\|\nabla\xi\|_{0,\mathcal{A}_h}\). Therefore, the previous methodology to obtain error estimates cannot be applied in the present case.
Suppose that we introduce an elementwise constant function \( \bar{\xi} \) to be defined later. Then, we can rewrite (4.7) as:

\[
\| \nabla \xi \|_{0,K}^2 = B_+ (\eta, \xi) = B_+ (\eta, \xi - \bar{\xi}) = B_+ (\eta, \xi - \bar{\xi}) + B_+ (\eta, \bar{\xi}). \tag{4.8}
\]

Suppose now we can construct a new interpolant such that:

\[
B_+ (\eta, \xi) = 0. \tag{4.9}
\]

Then we would have

\[
\| \nabla \xi \|_{0,K}^2 = B_+ (\eta, \xi) = B_+ (\eta, \xi - \bar{\xi})
= B (\eta, \xi - \bar{\xi}) - J (\eta, \xi - \bar{\xi}) + J (\xi - \bar{\xi}, \eta)
= B (\eta, \xi) - J (\eta, \xi - \bar{\xi}) + J (\xi, \eta) \tag{4.10}
\]

We have seen that the terms \( B (\eta, \xi) \) and \( J (\xi, \eta) \) are easily bounded in terms of \( \| \nabla \xi \|_{0,K} \). The other term reads:

\[
J (\eta, \xi - \bar{\xi}) = \int_{\Gamma_{int} \cup \Gamma_D} \langle \mathbf{n} \cdot \nabla \eta \rangle \left[ \xi - \bar{\xi} \right] ds.
\]

According to Lemma A.5, this integral can be bounded with respect to \( \| \nabla \xi \|_{0,K} \) under the condition that \( \bar{\xi} \) is chosen as the average of \( \xi \) on each element.

This approach has been followed in principle by Rivière, Wheeler and Girault in [20,19] where they construct special interpolants \( \pi u \) which satisfied (4.9) and

\[
\| u - \pi u \|_{0,K} \leq C \frac{h_{K}^{\mu}}{p_{K}^{s-2}} \| u \|_{s,K},
\]

\[
\| \nabla (u - \pi u) \|_{0,K} \leq C \frac{h_{K}^{\mu-1}}{p_{K}^{s-2}} \| u \|_{s,K},
\]

\[
\| \nabla^2 (u - \pi u) \|_{0,K} \leq C \frac{h_{K}^{\mu-2}}{p_{K}^{s-2}} \| u \|_{s,K},
\]

where \( \mu = \min(p_{K} + 1, s), s \geq 2, p_{K} \geq 2. \) Using these interpolants, they were able to derive an \textit{a priori} error estimate of the form:

\[
\| \nabla e \|_{0,K} \leq C \frac{h_{K}^{\mu-1}}{p^{s-4}} \| u \|_{s}. \tag{4.11}
\]

Although the rate of convergence is optimal in \( h \), we show next that the rate of convergence in \( p \) is in reality better than \( (s - 4) \). We improve this result by constructing better approximation properties for the new interpolant and by refining the analysis.
4.2.3. New Interpolants

Lemma 4.1 Let \( K \) be a triangular element of the partition \( P_h \) and \( u \) a function in \( H^s(K) \), \( s \geq 2 \). There exists a positive constant \( C \) depending on \( s \) and \( p \) but independent of \( u, p_K, \) and \( h_K \), and a polynomial \( \pi u \in P_{p_K}(K) \), \( p_K \geq 2 \), such that

\[
\int_\gamma \mathbf{n} \cdot \nabla (u - \pi u) \, ds = 0, \quad \forall \gamma \subset \partial K, \tag{4.12}
\]

and

\[
\| u - \pi u \|_{0,K} \leq C \frac{h_K^{\mu}}{p_K^{s-3/2}} \| u \|_{s,K},
\]

\[
\| \nabla (u - \pi u) \|_{0,K} \leq C \frac{h_K^{\mu-1}}{p_K^{s-3/2}} \| u \|_{s,K}, \tag{4.13}
\]

\[
\| \nabla^2(u - \pi u) \|_{0,K} \leq C \frac{h_K^{\mu-2}}{p_K^{s-2}} \| u \|_{s,K},
\]

where \( \mu = \min(p_K + 1, s) \).

We present the proof of this theorem for triangular elements only. The proof is similar for quadrilaterals.

**Proof:** Let the triangle \( K \in \Omega \) be the image of the master element \( \hat{K} \) by the affine mapping \( F_K \) as shown in Figure 2. The mapping \( F_K \) is often rewritten as:

\[
F_K(\hat{x}) = B\hat{x} + b \tag{4.14}
\]

where \( B \) represents a two-by-two matrix whose components are independent of \( \hat{x} \) and \( b \) is a two-dimensional vector. Here, \( \gamma \) will refer to the edge between node \( N_2 \) and \( N_3 \), unless stated otherwise, and \( \hat{\gamma} \) on \( \hat{K} \) will denote its image by \( F_K^{-1} \). We associate with \( \hat{\gamma} \) and \( \gamma \) the unit normal vector \( \hat{n} \) and \( n \), respectively.

Given \( \eta \in H^2(K) \), namely \( \eta = u - z_p \), where \( z_p \) is the interpolant of \( u \) as defined in Lemma A.7, the objective here is to construct a polynomial function \( q \) in \( \Psi^{hp}(K) \) such that:

\[
\int_\gamma \mathbf{n} \cdot \nabla \eta \, ds = \int_\gamma \mathbf{n} \cdot \nabla q \, ds. \tag{4.15}
\]

Indeed we would have:

\[
\int_\gamma \mathbf{n} \cdot \nabla (\eta - q) \, ds = \int_\gamma \mathbf{n} \cdot \nabla (u - z_p - q) \, ds = \int_\gamma \mathbf{n} \cdot \nabla (u - (z_p + q)) \, ds = 0,
\]

and the new interpolant could be derived as \( \pi u = z_p + q \).
Following [19], and assuming $p_K \geq 2$, we introduce the polynomial function $\hat{q}_\gamma$ associated with the edge $\gamma$ on $\hat{K}$:

$$\hat{q}_\gamma = C_\gamma (1 - \hat{x} - \hat{y})(\hat{x} + \hat{y}), \quad \forall \hat{x} = (\hat{x}, \hat{y}) \in \hat{K}. \quad (4.16)$$

where $C_\gamma$ is a constant to be defined. We observe in Fig. 3 that such a polynomial function satisfies:

$$\int_{\gamma_{12}} \hat{n} \cdot \nabla \hat{q}_\gamma \, ds = 0$$
$$\int_{\gamma_{23}} \hat{n} \cdot \nabla \hat{q}_\gamma \, ds = -2C_\gamma$$
$$\int_{\gamma_{31}} \hat{n} \cdot \nabla \hat{q}_\gamma \, ds = 0$$

with $\gamma_{ij}$ defining an edge on $\hat{K}$ joining the nodes $N_i$ and $N_j$.
The constant $C_\gamma$ is found so that (4.15) is satisfied in the physical space. Further-
more, we obtain an upper bound for $C_\gamma$ (see Rivièere [19]) as:

$$|C_\gamma| \leq C \|B\|^2 \|B^{-1}\|^2 \|\nabla \eta\|_{0,\gamma}$$

$$\leq C \left(\frac{h_K}{\hat{\rho}}\right)^2 \left(\frac{\hat{h}}{\rho_K}\right)^2 h_k^{1/2} \|\nabla \eta\|_{0,\gamma}$$

$$\leq C \sigma^2 \left(\frac{\hat{h}}{\hat{\rho}}\right)^2 h_k^{1/2} \|\nabla \eta\|_{0,\gamma}$$

$$\leq C h_k^{1/2} \|\nabla \eta\|_{0,\gamma}$$

$$\leq C \left\{ \|\nabla \eta\|_{0,K}^2 + h_k \|\nabla \eta\|_{0,K} \|\nabla^2 \eta\|_{0,K} \right\}^{1/2}$$

where we make use of the Trace Inequality (A.3). We also observe that:

$$\|q_\gamma\|_{0,K} \leq C |\det B|^{1/2} \|q_\gamma\|_{0,K}$$

$$\leq C h_k \|C_\gamma\| |\hat{K}|$$

$$\leq C h_k |C_\gamma|.$$

Likewise, we have:

$$\|\nabla q_\gamma\|_{0,K} \leq C |C_\gamma|$$

$$\|\nabla^2 q_\gamma\|_{0,K} \leq C h_k^{-1} |C_\gamma|$$

So far, we have carried out the analysis for the edge $\gamma$ between node $N_2$ and $N_3$. We point out that the same results are obtained for the other two edges. We then associate with each edge $\gamma_{12}$, $\gamma_{23}$, $\gamma_{31}$, a polynomial $q_{12}$, $q_{23}$, $q_{31}$ respectively such
that
\[
\hat{q}_{12} = C_{12} \hat{y}(1 - \hat{y}) \\
\hat{q}_{23} = C_{23} (1 - \hat{x} - \hat{y})(\hat{x} + \hat{y}) \\
\hat{q}_{31} = C_{31} \hat{x}(1 - \hat{x})
\]

Adding these polynomial functions together, we construct on the element \( K \) a new function \( q \in P_2(K) \)
\[
q(x) = q_{12}(x) + q_{23}(x) + q_{31}(x), \quad \forall x \in K,
\]
which satisfies
\[
\int_{\gamma_{12}} \mathbf{n} \cdot \nabla q \, ds = \int_{\gamma_{12}} \mathbf{n} \cdot \nabla (q_{12} + q_{23} + q_{31}) \, ds = \int_{\gamma_{12}} \mathbf{n} \cdot \nabla q_{12} \, ds = \int_{\gamma_{12}} \mathbf{n} \cdot \nabla \eta \, ds,
\]
\[
\int_{\gamma_{23}} \mathbf{n} \cdot \nabla q \, ds = \int_{\gamma_{23}} \mathbf{n} \cdot \nabla (q_{12} + q_{23} + q_{31}) \, ds = \int_{\gamma_{23}} \mathbf{n} \cdot \nabla q_{23} \, ds = \int_{\gamma_{23}} \mathbf{n} \cdot \nabla \eta \, ds,
\]
\[
\int_{\gamma_{31}} \mathbf{n} \cdot \nabla q \, ds = \int_{\gamma_{31}} \mathbf{n} \cdot \nabla (q_{12} + q_{23} + q_{31}) \, ds = \int_{\gamma_{31}} \mathbf{n} \cdot \nabla q_{31} \, ds = \int_{\gamma_{31}} \mathbf{n} \cdot \nabla \eta \, ds.
\]

In other words, there exists a function \( \pi u \in P_P(K), \pi u = \pi p + q \) such that
\[
\int_{\gamma} \mathbf{n} \cdot \nabla (u - \pi u) \, ds = 0, \quad \forall \gamma \subset \partial K.
\]

Now, by the triangle inequality,
\[
\| u - \pi u \|_{0,K} \leq \| u - \pi p \|_{0,K} + \| q \|_{0,K}
\leq \| \eta \|_{0,K} + \| q_{12} \|_{0,K} + \| q_{23} \|_{0,K} + \| q_{31} \|_{0,K}
\leq \| \eta \|_{0,K} + C h_K \left\{ \| \nabla \eta \|_{0,K}^2 + h_K^2 \| \nabla \|_{0,K} \| \nabla^2 \eta \|_{0,K} \right\}^{1/2}
\leq C \left\{ \frac{\mu^2}{p_K^2} + h_K \left( \frac{\mu^2}{p_K^2} - \frac{\mu^2}{p_K^2} \right) \right\} \| u \|_{s,K}
\leq C \left\{ \frac{\mu}{p_K^2} + \frac{\mu^2-1}{p_K^{3/2}} \right\} \| u \|_{s,K}
\leq C \frac{\mu^2}{p_K^{3/2}} \| u \|_{s,K}.
\]
In the same manner, we find:

\[
\| \nabla (u - \pi u) \|_{0,K} \leq \| \nabla (u - z_p) \|_{0,K} + \| \nabla q \|_{0,K}
\]

\[
\leq \| \nabla \eta \|_{0,K} + C \left\{ \| \nabla \eta \|_{0,K}^2 + h_K \| \nabla \eta \|_{0,K} \| \nabla^2 \eta \|_{0,K} \right\}^{1/2}
\]

\[
\leq C \left( \frac{h_K^{-1}}{p_k^s} + \frac{h_K^{-1}}{p_k^{s-3/2}} \right) \| \nabla \|_{s,K}
\]

\[
\leq C \frac{h_K^{-1}}{p_k^{s-3/2}} \| \nabla \|_{s,K},
\]

and

\[
\| \nabla^2 (u - \pi u) \|_{0,K} \leq \| \nabla^2 (u - z_p) \|_{0,K} + \| \nabla^2 q \|_{0,K}
\]

\[
\leq \| \nabla^2 \eta \|_{0,K} + Ch_K^{-1} \left\{ \| \nabla \eta \|_{0,K}^2 + h_K \| \nabla \eta \|_{0,K} \| \nabla^2 \eta \|_{0,K} \right\}^{1/2}
\]

\[
\leq C \left( \frac{h_K^{-2}}{p_k^{s-2}} + \frac{h_K^{-2}}{p_k^{s-3/2}} \right) \| \nabla \|_{s,K}
\]

\[
\leq C \frac{h_K^{-2}}{p_k^{s-3/2}} \| \nabla \|_{s,K}.
\]

We observe that the first two estimates are governed by the rate of convergence of \( q \|_{0,K} \) and \( \nabla q \|_{0,K} \) respectively, while the last estimate is governed by the rate of convergence of \( \nabla^2 \eta \|_{0,K} \).

\[\square\]

4.2.4. \textit{A priori} error estimate when \( c \) is zero

\textbf{Theorem 4.3} Let \( u \in H^1(\Omega) \cap H^s(\mathcal{P}_h) \), \( s \geq 2 \) be a solution of (3.23) and \( u_h \) be the discrete discontinuous solution of (3.24) with \( c = 0 \) and \( p \geq 2 \). Then, the numerical error \( e = u - u_h \) satisfies:

\[
\| \nabla e \|_{0,q_h} \leq C \frac{h_k^{\mu-1}}{p_k^{s-3/2}} \| \nabla \|_{s}
\]  \hspace{1cm} (4.17)

where \( \mu = \min(p + 1, s) \).

\textbf{Proof:} Let \( \pi u \) be the interpolant of \( u \) in \( V^{hp} \), defined on each element \( K \) of \( \mathcal{P}_h \) as in Lemma 4.1. We also introduce \( \eta = u - \pi u \) and \( \xi = u_h - \pi u \). Using the triangle inequality, we have:

\[
\| \nabla e \|_{0,q_h} = \| \nabla (\eta - \xi) \|_{0,q_h} \leq \| \nabla \eta \|_{0,q_h} + \| \nabla \xi \|_{0,q_h}
\]
and from (4.7) and (4.8), we recall that:

\[ \| \nabla \xi \|^2_{0,h} = \mathcal{B}_+ (\eta, \xi) = \mathcal{B}_+ (\eta, \xi - \bar{\xi}) + \mathcal{B}_+ (\eta, \bar{\xi}). \]

Here \( \bar{\xi} \) is chosen as the average of \( \xi \) over each \( K \), i.e.

\[ \bar{\xi} = \frac{1}{|K|} \int_K \xi \, dx, \quad K \in \mathcal{T}_h. \]

We note here that the authors in [20,19] chose \( \bar{\xi} \) as the average of \( \xi \) over each edge and their proof is thus slightly different from ours.

This particular choice of the interpolant \( \pi u \) and piecewise constant function \( \bar{\xi} \) does indeed yield:

\[ \mathcal{B}_+ (\eta, \bar{\xi}) = \mathcal{B}(\eta, \bar{\xi}) - J(\eta, \bar{\xi} - J(\bar{\xi}, \eta) = -J(\eta, \bar{\xi}) \]

\[ = - \int_{\Gamma_{\text{int}}} \langle \mathbf{n} \cdot \nabla \eta \rangle [\bar{\xi}] \, ds \]

\[ = - \int_{\Gamma_{\text{int}}} \langle \mathbf{n} \cdot \nabla \eta \rangle ds \]

\[ = 0 \]

since the last integral is zero according to the property (4.12) of the interpolant \( \pi u \).

Therefore

\[ \| \nabla \xi \|_{0,h}^2 = \mathcal{B}_+ (\eta, \xi - \bar{\xi}) \] (4.18)

We now show how \( \mathcal{B}_+ (\eta, \xi - \bar{\xi}) \) can be bounded with respect to \( \| \nabla \xi \|_{0,h} \). We naturally have from (4.10)

\[ | \mathcal{B}_+ (\eta, \xi - \bar{\xi}) | \leq | \mathcal{B}(\eta, \xi) | + | J(\eta, \xi - \bar{\xi}) | + | J(\xi, \eta) | \]

The first term gives, using the approximation properties of Lemma 4.1 and the discrete Schwarz inequality:

\[ | \mathcal{B}(\eta, \xi) | \leq \sum_{K \in \mathcal{T}_h} \int_K | \nabla \eta \cdot \nabla \xi | \, dx \leq \sum_{K \in \mathcal{T}_h} \| \nabla \eta \|_{0,K} \| \nabla \xi \|_{0,K} \]

\[ \leq \sum_{K \in \mathcal{T}_h} C \frac{h_k^{\mu-1}}{p_k^{\mu-3/2}} \| u \|_{s,K} \| \nabla \xi \|_{0,K} \]

\[ \leq C \frac{h_k^{\mu-1}}{p_k^{\mu-3/2}} \| u \|_{s} \| \nabla \xi \|_{0,h} \]
The third term is treated as usual. We have

$$|J(\xi, \eta)| \leq \int_{\Gamma_D \backslash \Gamma_D} |\langle n \cdot \nabla \xi \rangle | \eta |\, ds \leq \sum_{\gamma} \| \langle n \cdot \nabla \xi \rangle \|_{0, \gamma} \| \eta \|_{0, \gamma}$$

$$\leq C \sum_{K \in \mathcal{H}, \gamma \in \partial K \backslash \Gamma_N} \| n \cdot \nabla \xi \|_{0, \gamma} \| \eta \|_{0, \gamma}$$

$$\leq C \sum_{K \in \mathcal{H}, \gamma \in \partial K \backslash \Gamma_N} \| \nabla \xi \|_{0, \gamma} \| \eta \|_{0, \gamma}$$

From the trace inequality (A.3) and the inverse property (A.7), we show that:

$$\| \nabla \xi \|_{0, \gamma} \leq C \left\{ \frac{1}{h_K} \| \nabla \xi \|_{0, K}^2 + \| \nabla \xi \|_{0, K} \| \nabla^2 \xi \|_{0, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{1}{h_K} \| \nabla \xi \|_{0, K}^2 + \| \nabla \xi \|_{0, K} C_0 \frac{p_K^2}{h_K} \| \nabla \xi \|_{0, K} \right\}^{1/2}$$

$$\leq C \frac{p_K}{h_K^{1/2}} \| \nabla \xi \|_{0, K}$$

and, from the approximation properties of Lemma 4.1:

$$\| \eta \|_{0, \gamma} \leq C \left\{ \frac{1}{h_K} \| \eta \|_{0, K}^2 + \| \eta \|_{0, K} \| \nabla \eta \|_{0, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{1}{h_K} \frac{h_K^{2\mu}}{p_K^{2\mu}} \| u \|_{s, K}^2 + \frac{h_K^{2\mu-1}}{p_K^{2\mu-1}} \frac{h_K^{2\mu-1}}{p_K^{2\mu-1}} \frac{h_K^{2\mu-1}}{p_K^{2\mu-1}} \| u \|_{s, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{h_K^{2\mu-1}}{p_K^{2\mu-3}} + \frac{h_K^{2\mu-1}}{p_K^{2\mu-3}} \right\}^{1/2} \| u \|_{s, K}$$

$$\leq C \frac{h_K^{2\mu-1}}{p_K^{s-3/2}} \| u \|_{s, K}$$

In conclusion, we find that:

$$|J(\xi, \eta)| \leq C \sum_{K \in \mathcal{H}, \gamma \in \partial K \backslash \Gamma_N} \frac{p_K}{h_K^{1/2}} \| \nabla \xi \|_{0, K} \frac{h_K^{2\mu-1/2}}{p_K^{s-3/2}} \| u \|_{s, K}$$

$$\leq C \sum_{K \in \mathcal{H}, \gamma \in \partial K \backslash \Gamma_N} \frac{h_K^{2\mu-1} p_K}{p_K^{2\mu-1} p_K^{s-5/2}} \| \nabla \xi \|_{0, K} \| u \|_{s, K}$$

$$\leq C \frac{h_K^{2\mu-1} p_K}{p_K^{s-5/2}} \| u \|_{s} \| \nabla \xi \|_{0, \gamma}.$$
In the same manner as before, we obtain for the term $J(\eta, \xi - \bar{\xi})$:

$$|J(\eta, \xi - \bar{\xi})| \leq C \sum_{k \in \mathcal{V}_h} \sum_{\gamma \in \partial k} \|\nabla \eta\|_{0, \gamma} \|\xi - \bar{\xi}\|_{0, \gamma}$$

In this case, we have using also the approximation properties of the interpolant:

$$\|\nabla \eta\|_{0, \gamma} \leq C \left\{ \frac{1}{h_K} \|\nabla \eta\|_{0, K}^2 + \|\nabla \eta\|_{0, K} \|\nabla^2 \eta\|_{0, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{1}{h_K^2} \|\nabla \eta\|_{0, K}^2 + \frac{h_K^{\mu-1}}{p_K^{s-3/2}} \|\nabla^2 \eta\|_{0, K}^2 \right\}^{1/2}$$

$$\leq C \left\{ \frac{h_K^{\mu-3}}{p_K^{s-7/4}} + \frac{h_K^{\mu-2}}{p_K^{s-7/2}} \right\} \|\nabla \eta\|_{s, K}$$

However, for the other term, we have, using Lemma A.5:

$$\|\xi - \bar{\xi}\|_{0, \gamma} \leq C \left\{ \frac{1}{h_K} \|\xi - \bar{\xi}\|_{0, K}^2 + \|\xi - \bar{\xi}\|_{0, K} \|\nabla (\xi - \bar{\xi})\|_{0, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{1}{h_K} \|\xi - \bar{\xi}\|_{0, K}^2 + \|\xi - \bar{\xi}\|_{0, K} \|\nabla \xi\|_{0, K} \right\}^{1/2}$$

$$\leq C \left\{ \frac{1}{h_K^2} \|\nabla \xi\|_{0, K}^2 + h_K \|\nabla \xi\|_{0, K} \|\nabla \xi\|_{0, K} \right\}^{1/2}$$

$$\leq Ch_K^{1/2} \|\nabla \xi\|_{0, K}$$

It follows that:

$$|J(\eta, \xi - \bar{\xi})| \leq C \sum_{k \in \mathcal{V}_h} \frac{h_K^{\mu-3/2}}{p_K^{s-7/4}} \|\nabla \xi\|_{s, K} h_K^{1/2} \|\nabla \xi\|_{0, K}$$

$$\leq C \sum_{k \in \mathcal{V}_h} \frac{h_K^{\mu-1}}{p_K^{s-7/4}} \|\nabla \xi\|_{s, K} \|\nabla \xi\|_{0, K}$$

$$\leq C \frac{h_K^{\mu-1}}{p_K^{s-5/4}} \|\nabla \xi\|_{s, K} \|\nabla \xi\|_{0, \mathcal{V}_h}$$

Combining the previous results, we finally get:

$$\|\nabla \xi\|_{0, \mathcal{V}_h} \leq C \left( \frac{h_K^{\mu-1}}{p_K^{s-1/2}} + \frac{h_K^{\mu-1}}{p_K^{s-7/4}} + \frac{h_K^{\mu-1}}{p_K^{s-5/2}} \right) \|\nabla \xi\|_{s, K} \leq C \frac{h_K^{\mu-1}}{p_K^{s-5/2}} \|\nabla \xi\|_{s, K}$$

and this completes the proof since $\|\nabla \eta\|_{0, \mathcal{V}_h}$ converges with a greater rate of convergence than $\|\nabla \xi\|_{0, \mathcal{V}_h}$. \qed
4.2.5. Alternative estimate when $c$ is nonzero

We now use the previous results to review the error estimate when $c$ is nonzero. The new estimate is given in the following theorem:

**Theorem 4.4** Let $u \in H^1(\Omega) \cap H^s(\mathcal{T}_h)$, $s \geq 2$, be a solution of (3.23) with $c > 0$ and $u_h$ be the discrete discontinuous solution of (3.24). Then, the numerical error $e = u - u_h$ satisfies:

$$
\| e \|_{c, \mathcal{T}_h} \leq C \frac{h^{\mu-1}}{p^{s-3/2}} \| u \|_{s}
$$

(4.19)

where $\mu = \min(p + 1, s)$ and $p \geq 2$.

**Proof:** In this case, we have:

$$
\| \xi \|_{c, \mathcal{T}_h}^2 = B_+(\eta, \xi)
$$

$$
= B(\eta, \xi) - J(\eta, \xi) + J(\xi, \eta)
$$

$$
= B(\eta, \xi) - J(\eta, \xi - \xi) - J(\eta, \xi) + J(\xi, \eta)
$$

$$
= B(\eta, \xi) - J(\eta, \xi - \xi) + J(\xi, \eta)
$$

$$
\leq |B(\eta, \xi)| + |J(\eta, \xi - \xi)| + |J(\xi, \eta)|
$$

if the interpolant is chosen as in Lemma 4.1.

Moreover, results from the previous theorem provide us with:

$$
|B(\eta, \xi)| \leq \sum_{K \in \mathcal{T}_h} \int_K |\nabla \eta \cdot \nabla \xi + c\eta \xi| \, dx \leq C \frac{h^{\mu-1}}{p^{s-3/2}} \| u \|_{s} \| \xi \|_{c, \mathcal{T}_h},
$$

$$
|J(\xi, \eta)| \leq C \frac{h^{\mu-1}}{p^{s-5/2}} \| u \|_{s} \| \nabla \xi \|_{0, \mathcal{T}_h} \leq C \frac{h^{\mu-1}}{p^{s-5/2}} \| u \|_{s} \| \xi \|_{c, \mathcal{T}_h},
$$

$$
|J(\eta, \xi)| \leq C \frac{h^{\mu-1}}{p^{s-7/4}} \| u \|_{s} \| \nabla \xi \|_{0, \mathcal{T}_h} \leq C \frac{h^{\mu-1}}{p^{s-7/4}} \| u \|_{s} \| \xi \|_{c, \mathcal{T}_h},
$$

so that

$$
\| \xi \|_{c, \mathcal{T}_h} \leq C h^{\mu-1} \frac{h^{s-5/2}}{p^{s-3/2}} \| u \|_{s},
$$

and this completes the proof. \qed

This time, the rate of convergence is optimal with respect to $h$ but the rate of convergence in $p$ is worse than in the previous estimate. This makes us believe that the error estimates for the DG method can still be improved with respect to $p$. Maybe better interpolants are yet to be found.
5. Concluding Remarks

5.1. Remarks on the Discontinuous Formulations

In this report, we studied four different formulations of the so-called Discontinuous Galerkin Method (DGM). These formulations simply vary by one sign (plus or minus) and by the addition of a penalty term (or not). However, they greatly differ in nature from a mathematical point of view. We now review each formulation one by one and recount our findings in the case of linear diffusion problems.

**Global Element Method.** Little can be proved for this method. We were able to derive the continuity of the associated bilinear form, but failed to even obtain \(a\) \textit{priori} error estimates. This is because the bilinear form is not guaranteed to be semi-positive definite.

**Symmetric Interior Penalty Galerkin Method.** The SIPG Method is similar to the GEM except for the addition of the penalty term. However, it allows us to prove non only continuity of the bilinear form, but also coercivity in the discrete discontinuous space (for sufficiently large values of the penalty parameter), and thus \(a\) \textit{priori} error estimates optimal with respect to \(h(\mu - 1)\) and slightly suboptimal with respect to \(p(s - 3/2)\). One major drawback of this method is that its behavior depends on the selection of the penalty parameter. If not chosen carefully, the method can fail.

**Non-Symmetric Interior Penalty Galerkin Method.** The limitation of the SIPG method is remedied by changing one minus sign by a plus sign. Indeed, although the NIPG formulation results in a non-symmetric system of equations, all the properties and error estimates are shown to be independent of the choice of the penalty parameter. We also find the same rates of convergence with respect to \(h\) and \(p\) as SIPG.

**Discontinuous Galerkin Method.** DGM is deduced from the NIPG method by setting the penalty parameter to zero. We then observe that the rate of convergence with respect to \(h\) or \(p\) deteriorates. Also, in the case of the pure Laplacian operator, when \(c\) is set to zero in the Poisson problem, we obtain \(a\) \textit{priori} error estimates only by defining some new interpolants whose fluxes are weakly equal to the fluxes of the exact solution over each edge of the elements. Although the rate of convergence in \(h\) remains optimal, the one in \(p\) is then estimated to be \(s - 5/2\). We believe that it might be possible to improve this rate of convergence by considering other types of interpolants. At this point, detailed numerical experiments would be helpful to understand how the penalty term affects the quality of the approximations.

5.2. Future Challenges

The great challenges for DGMs are to 1) prove uniqueness of the solutions of the continuous formulations, 2) perform more numerical experiments to understand
the role played by the penalty terms, 3) still improve the \textit{a priori} error estimates for the Discontinuous Galerkin Method of Baumann and Oden, 4) derive rigorous \textit{a posteriori} error estimates for the various formulations.

\textbf{REFERENCES}

A. Appendix

A.1. Discrete Schwarz Inequality

Lemma A.1 Let \( \{a_i\} \) and \( \{b_i\} \) define two sequences of \( N \) real numbers. Then

\[
\sum_{i=1}^{N} a_i b_i \leq \left( \sum_{i=1}^{N} a_i^2 \right)^{1/2} \left( \sum_{i=1}^{N} b_i^2 \right)^{1/2} \quad (A.1)
\]

Proof: We shall show the discrete Schwarz inequality for \( N = 2 \) first. We have:

\[
(a_1 b_1 + a_2 b_2)^2 = a_1^2 b_1^2 + a_2^2 b_2^2 + 2a_1 b_1 a_2 b_2
\]

\[
= (a_1^2 + a_2^2)(b_1^2 + b_2^2) - a_1^2 b_2^2 - a_2^2 b_1^2 + 2a_1 b_1 a_2 b_2
\]

\[
= (a_1^2 + a_2^2)(b_1^2 + b_2^2) - (a_1 b_2 - a_2 b_1)^2
\]

\[
\leq (a_1^2 + a_2^2)(b_1^2 + b_2^2)
\]

so that:

\[
a_1 b_1 + a_2 b_2 \leq \sqrt{a_1^2 + a_2^2} \sqrt{b_1^2 + b_2^2}.
\]

The result is easily extended to \( N > 2 \) by recursivity. \( \square \)

A.2. Multiplicative Trace Inequalities

Lemma A.2 Let \( \Omega \) define a star-shaped domain with a smooth boundary \( \partial \Omega \) as shown in Fig. 4. Then, for all \( v \in H^1(\Omega) \)

\[
\|v\|_{0, \partial \Omega}^2 \leq \frac{2}{\inf_{x \in \partial \Omega} |x|} \left( \|v\|_{0, \Omega}^2 + \sup_{x \in \Omega} |x| \|v\|_{0, \Omega} \|\nabla v\|_{0, \Omega} \right) . \quad (A.2)
\]

Proof: Let \( O \in \Omega \) be the origin and let \( n \) denote the unit normal outward vector on \( \partial \Omega \). From the definition of a star-shaped domain, there exists a positive constant \( \beta \) such that

\[
\beta |x| \leq x \cdot n.
\]

Applying Green’s Theorem for the vector field \( u^2 x \), we have:

\[
\int_{\partial \Omega} u^2 x \cdot n \, ds = \int_{\Omega} \nabla \cdot (u^2 x) \, dx.
\]

By the property of star-shaped domains, the first integral is shown to be bounded below:

\[
\int_{\partial \Omega} u^2 x \cdot n \, ds \geq \beta \inf_{x \in \partial \Omega} |x| \int_{\Omega} u^2 \, ds \geq \beta \inf_{x \in \partial \Omega} |x| \|u\|_{0, \partial \Omega}^2.
\]
On the other hand, the second integral is bounded above:

\[
\int_\Omega \nabla \cdot (u^2 x) \, dx = \int_\Omega u^2 \nabla \cdot x + x \cdot \nabla u^2 \, dx \\
= \int_\Omega 2u^2 \, dx + \int_\Omega 2ux \cdot \nabla u \, dx \\
\leq 2\|u\|^2_{0,\Omega} + \int_\Omega |ux| |\nabla u| \, dx \\
\leq 2\|u\|^2_{0,\Omega} + 2\sup_{x \in \Omega} |x| \int_\Omega |u| |\nabla u| \, dx \\
\leq 2\|u\|^2_{0,\Omega} + 2\sup_{x \in \Omega} |x| \|u\|_{0,\Omega} \|\nabla u\|_{0,\Omega}
\]

Using both bounds, we arrive at:

\[
\|u\|^2_{0,\partial \Omega} \leq \frac{2}{\inf_{x \in \partial \Omega} |x|} \left( \|u\|^2_{0,\Omega} + \sup_{x \in \Omega} |x| \|u\|_{0,\Omega} \|\nabla u\|_{0,\Omega} \right)
\]

which completes the proof. \(\square\)

**Lemma A.3** Let \(K\) be a triangle or a quadrilateral such that \(h_K \leq \rho K\) (shape regular). Then, for all \(v \in H^1(K)\),

\[
\|v\|^2_{0,K} \leq C \left( \frac{1}{h_K} \|v\|^2_{0,K} + \|v\|_{0,K} \|\nabla v\|_{0,K} \right). \tag{A.3}
\]

where \(C\) is a positive constant.
Proof: Let the origin $O$ be the center of the inscribed circle in $K$ with radius $\rho_K/2$. We therefore have:

$$\sup_{x \in K} |x| \leq h_K$$

$$\inf_{x \in \partial K} |x| \geq \rho_K \geq h_K/q$$

so that from (A.2)

$$\|u\|_{0, \partial K}^2 \leq \frac{2 \rho}{h_K} \left( \|u\|_{0, K}^2 + h_K \|u\|_{0, K} \|\nabla u\|_{0, K} \right)$$

$$\leq 2 \rho \left( \frac{1}{h_K} \|u\|_{0, K}^2 + \|u\|_{0, K} \|\nabla u\|_{0, K} \right)$$

The proof is complete when choosing $C = 2 \rho$. \qed

A.3. Poincaré–Friedrich’s Inequalities

Lemma A.4 Let $\Omega$ be an open, bounded, connected domain of $\mathbb{R}^2$ with Lipschitz boundary $\partial \Omega$. Let $v \in H^1(\Omega)$ such that

$$\int_{\Omega} v \, dx = 0.$$  \hspace{1cm} (A.4)

Then

$$\|v\|_{0, \Omega} \leq C \|\nabla v\|_{0, \Omega}$$  \hspace{1cm} (A.5)

where $C = C(\Omega)$ is a positive constant.

Proof: See Schwab [21, p.350] and Brenner and Scott [8, p.102]. \qed

Lemma A.5 Let $z \in P_{p_k}(K)$ and $\bar{z}$ be the average of $z$ on $K$, $\bar{z} = (\int_K z \, dx) / |K|$. Then

$$\|z - \bar{z}\|_{0, K} \leq Ch_K \|\nabla z\|_{0, K}$$  \hspace{1cm} (A.6)

where $C$ is a positive constant independent of $K$ and $z$.

Proof: Let $z \in P_{p_k}(K)$ and $v = z - \bar{z}$. Then

$$\int_{\Omega} v \, dx = \int_{\Omega} z - \bar{z} \, dx = \int_{\Omega} z \, dx - \int_{\Omega} \bar{z} \, dx = |K| \bar{z} - \bar{z} |K| = 0.$$  

By a scaling argument and Lemma A.4,

$$\|v\|_{0, K} \leq Ch_K \|\hat{\delta}\|_{0, K} \leq C(\hat{K})h_K \|\hat{\nabla} \hat{\delta}\|_{0, K} \leq Ch_K \|\nabla v\|_{0, K}$$

Substituting $z - \bar{z}$ for $v$, it follows that $\|z - \bar{z}\|_{0, K} \leq Ch_K \|\nabla (z - \bar{z})\|_{0, K}$, in other words, since $\bar{z}$ is constant, $\|z - \bar{z}\|_{0, K} \leq Ch_K \|\nabla z\|_{0, K}$. \qed
A.4. Inverse Property

**Lemma A.6** Let \( z \in P_{pK}(K) \). Then

\[
\| \nabla z \|_{0,K} \leq \frac{C_{P_{pK}}^2}{h_K} \| z \|_{0,K}
\]

(A.7)

**Proof:** See Schwab [21, p.208]. □

A.5. Interpolation Error Estimates

**Lemma A.7** Let \( K \) be a triangle or parallelogram element of the partition \( \mathcal{T}_h \) and \( u \) a function in \( H^s(K) \). There exists a positive constant \( C \) depending on \( s \) and \( q \) but independent of \( u, p_K, \) and \( h_K \), and a sequence \( z_p \in P_{pK}(K), p_K = 1, 2, \ldots \), such that for any \( q, 0 \leq q \leq s \)

\[
\| u - z_p \|_{q,K} \leq \frac{C_{H^s,K}^{1/2}}{p_K} \| u \|_{s,K}, \quad s \geq 0
\]

(A.8)

\[
\| u - z_p \|_{0,\gamma} \leq \frac{C_{H^s,K}}{p_K^{s-1/2}} \| u \|_{s,K}, \quad s > \frac{1}{2}
\]

(A.9)

where \( \mu = \min(p_K + 1, s) \), \( h_K = \text{diam}(K) \) and \( \gamma \subset \partial K \).

**Proof:** See Babuška and Suri [3,4]. □
